#### Abstract

We study space-time regularity of the solution of the nonlinear stochastic heat equation in one spatial dimension driven by space-time white noise, with a rough initial condition. This initial condition is a locally finite measure $\mu$ with, possibly, exponentially growing tails. We show how this regularity depends, in a neighborhood of $t=0$, on the regularity of the initial condition. On compact sets in which $t>0$, the classical Hölder-continuity exponents $\frac{1}{4}$ - in time and $\frac{1}{2}-$ in space remain valid. However, on compact sets that include $t=0$, the Hölder continuity of the solution is $\left(\frac{\alpha}{2} \wedge \frac{1}{4}\right)$ - in time and $\left(\alpha \wedge \frac{1}{2}\right)$ - in space, provided $\mu$ is absolutely continuous with an $\alpha$-Hölder continuous density.

Keywords Nonlinear stochastic heat equation • Rough initial data • Sample path Hölder continuity • Moments of increments

[^0]
## 1 Introduction

Over the last few years, there has been considerable interest in the stochastic heat equation with non-smooth initial data:

$$
\left\{\begin{array}{l}
\left(\frac{\partial}{\partial t}-\frac{\nu}{2} \frac{\partial^{2}}{\partial x^{2}}\right) u(t, x)=\rho(u(t, x)) \dot{W}(t, x), \quad x \in \mathbb{R}, t \in \mathbb{R}_{+}^{*},  \tag{1.1}\\
u(0, \cdot)=\mu(\cdot) .
\end{array}\right.
$$

In this equation, $\dot{W}$ is a space-time white noise, $\rho: \mathbb{R} \rightarrow \mathbb{R}$ is a globally Lipschitz function and $\left.\mathbb{R}_{+}^{*}=\right] 0, \infty[$. The initial data $\mu$ is a signed Borel measure, which we assume belongs to the set
$\mathcal{M}_{H}(\mathbb{R}):=\left\{\right.$ signed Borel measures $\mu$, s.t. $\int_{\mathbb{R}} e^{-a x^{2}}|\mu|(\mathrm{d} x)<+\infty$, for all $\left.a>0\right\}$.
In this definition, $|\mu|:=\mu_{+}+\mu_{-}$, where $\mu=\mu_{+}-\mu_{-}$and $\mu_{ \pm}$are the two nonnegative Borel measures with disjoint support that provide the Jordan decomposition of $\mu$. The set $\mathcal{M}_{H}(\mathbb{R})$ can be equivalently characterized by the condition that

$$
\begin{equation*}
\left(|\mu| * G_{\nu}(t, \cdot)\right)(x)=\int_{\mathbb{R}} G_{\nu}(t, x-y)|\mu|(\mathrm{d} y)<+\infty, \quad \text { for all } t>0 \text { and } x \in \mathbb{R} \tag{1.2}
\end{equation*}
$$

where $*$ denotes the convolution in the space variable and $G_{\nu}(t, x)$ is the onedimensional heat kernel function

$$
\begin{equation*}
G_{\nu}(t, x):=\frac{1}{\sqrt{2 \pi v t}} \exp \left\{-\frac{x^{2}}{2 v t}\right\}, \quad(t, x) \in \mathbb{R}_{+}^{*} \times \mathbb{R} \tag{1.3}
\end{equation*}
$$

Therefore, $\mathcal{M}_{H}(\mathbb{R})$ is precisely the set of initial conditions for which the homogeneous heat equation has a solution for all time.

The use of non-smooth initial data is initially motivated by the parabolic Anderson model (in which $\rho(u)=u$ ) with initial condition given by the Dirac delta function $\mu=\delta_{0}$ (see [2], and more recently, [6,7,13]). These papers are mainly concerned with the study of the intermittency property, which is a property that concerns the behavior of moments of the solution $u(t, x)$. Some very precise moment estimates have also been recently obtained by the authors in [5].

In this paper, we are interested in space-time regularity of the sample paths $(t, x) \mapsto$ $u(t, x)$, and, in particular, in how this regularity depends, in a neighborhood of $\{0\} \times \mathbb{R}$, on the regularity of the initial condition $\mu$.

Given a subset $D \subseteq \mathbb{R}_{+} \times \mathbb{R}$ and positive constants $\beta_{1}, \beta_{2}$, denote by $C_{\beta_{1}, \beta_{2}}(D)$ the set of functions $v: \mathbb{R}_{+} \times \mathbb{R} \rightarrow \mathbb{R}$ with the following property: for each compact subset $\tilde{D} \subset D$, there is a finite constant $c$ such that for all $(t, x)$ and $(s, y)$ in $\tilde{D}$,

$$
|v(t, x)-v(s, y)| \leq c\left(|t-s|^{\beta_{1}}+|x-y|^{\beta_{2}}\right) .
$$

Let

$$
C_{\beta_{1}-, \beta_{2}-}(D):=\cap_{\left.\alpha_{1} \in\right] 0, \beta_{1}[ } \cap_{\left.\alpha_{2} \in\right] 0, \beta_{2}[ } C_{\alpha_{1}, \alpha_{2}}(D)
$$

When the measure $\mu$ has a bounded density $f$ with respect to Lebesgue measure, then the initial condition is written $u(0, x)=f(x)$, for all $x \in \mathbb{R}$. When $f$ is bounded, then the Hölder continuity of $u$ was already studied in [28, Corollary 3.4 , p. 318]. In [2], it is stated, for the parabolic Anderson model, that if the initial data satisfies

$$
\sup _{t \in[0, T]} \sup _{x \in \mathbb{R}} \sqrt{t}\left(\mu * G_{v}(t, \circ)\right)(x)<\infty, \quad \text { for all } T>0
$$

then $u \in C_{\frac{1}{4}-, \frac{1}{2}-}\left(\mathbb{R}_{+}^{*} \times \mathbb{R}\right)$, a.s. In $[21,26]$, this result is extended to the case where the initial data is a continuous function with tails that grow at most exponentially at $\pm \infty$. Hölder continuity properties for more general parabolic problems, but mainly on bounded domains rather than $\mathbb{R}$, and with function-valued initial conditions, have aso been obtained using maximal inequalities and stochastic convolutions: see [3,20,25].

Sanz-Solé and Sarrà [24] considered the stochastic heat equation over $\mathbb{R}^{d}$ with spatially homogeneous colored noise which is white in time. Assuming that the spectral measure $\tilde{\mu}$ of the noise satisfies

$$
\begin{equation*}
\left.\int_{\mathbb{R}^{d}} \frac{\tilde{\mu}(\mathrm{~d} \xi)}{\left(1+|\xi|^{2}\right)^{\eta}}<+\infty, \quad \text { for some } \eta \in\right] 0,1[, \tag{1.4}
\end{equation*}
$$

they proved that if the initial data is a bounded $\rho$-Hölder continuous function for some $\rho \in] 0,1[$, then

$$
u \in C_{\frac{1}{2}(\rho \wedge(1-\eta))-, \rho \wedge(1-\eta)-}\left(\mathbb{R}_{+} \times \mathbb{R}\right), \quad \text { a.s. }
$$

where $a \wedge b:=\min (a, b)$. For the case of space-time white noise on $\mathbb{R}_{+} \times \mathbb{R}$, the spectral measure $\tilde{\mu}$ is Lebesgue measure and hence the exponent $\eta$ in (1.4) (with $d=1$ ) can take the value $\frac{1}{2}-\epsilon$ for any $\epsilon>0$. Their result ([23, Theorem 4.3]) implies that

$$
u \in C_{\left(\frac{1}{4} \wedge \frac{\rho}{2}\right)-,\left(\frac{1}{2} \wedge \rho\right)-}\left(\mathbb{R}_{+} \times \mathbb{R}\right), \quad \text { a.s. }
$$

More recently, in the paper [6, Lemma 9.3], assuming that the initial condition $\mu$ is a finite measure, Conus et al obtain tight upper bounds on moments of $u$ and bounds on moments of spatial increments of $u$ at fixed positive times: in particular, they show that $u$ is Hölder continuous in $x$ with exponent $\frac{1}{2}-\epsilon$.

Finally, in the papers [11,12], Dalang et al. considered a system of stochastic heat equations with vanishing initial conditions driven by space-time white noise, and proved that $u \in C_{\frac{1}{4}-, \frac{1}{2}-}\left(\mathbb{R}_{+} \times \mathbb{R}\right)$.

The purpose of this paper is to extend the above results to the case where $\mu \in$ $\mathcal{M}_{H}(\mathbb{R})$. In particular, we show that $u \in C_{\frac{1}{4}-, \frac{1}{2}-}\left(\mathbb{R}_{+}^{*} \times \mathbb{R}\right)$. Indeed, it is necessary to exclude the line $\{0\} \times \mathbb{R}$ unless the initial data $\mu$ has a density $f$ that is sufficiently
smooth (see part (2) of Theorem 3.1). Indeed, in this case, the regularity of $u$ in the neighborhood of $t=0$ can be no better than the regularity of $f$.

Recall that the rigorous interpretation of (1.1), used in [5], is the following integral equation:

$$
\begin{align*}
& u(t, x)=J_{0}(t, x)+I(t, x) \\
& I(t, x)=\iint_{[0, t] \times \mathbb{R}} G_{v}(t-s, x-y) \rho(u(s, y)) W(\mathrm{~d} s, \mathrm{~d} y), \tag{1.5}
\end{align*}
$$

where $J_{0}(t, x):=\left(\mu * G_{v}(t, \cdot)\right)(x)$, and the stochastic integral is interpreted in the sense of Walsh [28]. The regularity of $(t, x) \mapsto J_{0}(t, x)$ is classical (see Lemma 2.3), so the main effort is to understand the Hölder-regularity of $(t, x) \mapsto I(t, x)$ at $t=$ 0 . This is a delicate issue. In Theorem 3.1 and Proposition 4.3, we give sufficient conditions for sample path Hölder continuity of this function at $t=0$. However, we have not resolved this question for all initial conditions $\mu$. We do, however, show that for certain absolutely continuous $\mu$ with a locally unbounded density $f$, the function $t \mapsto u(t, x)$ from $[0,1]$ into $L^{p}(\Omega, \mathcal{F}, P)$, can have an optimal Hölder exponent that is arbitrarily close to 0 (see Proposition 3.5).

The difficulties for proving the Hölder continuity of $u$ lie in part in the fact that for initial data satisfying (1.2), $\mathbb{E}\left[|u(t, x)|^{p}\right]$ need not be bounded over $x \in \mathbb{R}$, and mainly in the fact that the initial data is irregular. Indeed, standard techniques, which isolate the effects of initial data by using the $L^{p}(\Omega)$-boundedness of the solution, fail in our case (see Remark 3.2). Instead, the initial data play an active role in our proof. We also note that Fourier transform techniques are not directly applicable here because $\mu$ need not be a tempered measure.

Finally, it is natural to ask in what sense the measure $\mu$ is indeed the initial condition for the stochastic heat equation? We show in Proposition 3.4 that $u(t, \cdot)$ converges weakly (in the sense of distribution theory) to $\mu$ as $t \downarrow 0$, so that $\mu$ is the initial condition of (1.1) in the classical sense used for deterministic p.d.e.'s [14, Chapter 7, Sect. 1].

The paper is structured as follows. In Sect. 2, we recall the results of [5] that we need here. Our main results are stated in Sect. 3. The proofs are presented in Sect. 4. Finally, some technical lemmas are listed in the appendix.

## 2 Some preliminaries

Let $W=\left\{W_{t}(A), A \in \mathcal{B}_{f}(\mathbb{R}), t \geq 0\right\}$ be a space-time white noise defined on a complete probability space $(\Omega, \mathcal{F}, P)$, where $\mathcal{B}_{f}(\mathbb{R})$ is the collection of Borel sets with finite Lebesgue measure. Let

$$
\mathcal{F}_{t}^{0}=\sigma\left(W_{s}(A), 0 \leq s \leq t, A \in \mathcal{B}_{f}(\mathbb{R})\right) \vee \mathcal{N}, \quad t \geq 0
$$

be the natural filtration of $W$ augmented by the $\sigma$-field $\mathcal{N}$ generated by all $P$-null sets in $\mathcal{F}$. For $t \geq 0$, define $\mathcal{F}_{t}:=\mathcal{F}_{t+}^{0}=\wedge_{s>t} \mathcal{F}_{s}^{0}$. In the following, we fix the filtered probability space $\left\{\Omega, \mathcal{F},\left\{\mathcal{F}_{t}, t \geq 0\right\}, P\right\}$. We use $\|\cdot\|_{p}$ to denote the $L^{p}(\Omega)$-norm
( $p \geq 1$ ). With this setup, $W$ becomes a worthy martingale measure in the sense of Walsh [28], and $\iint_{[0, t] \times \mathbb{R}} X(s, y) W(\mathrm{~d} s, \mathrm{~d} y)$ is well-defined in this reference for a suitable class of random fields $\left\{X(s, y),(s, y) \in \mathbb{R}_{+} \times \mathbb{R}\right\}$.

In this paper, we use $\star$ to denote the simultaneous convolution in both space and time variables.

Definition 2.1 A process $u=\left(u(t, x),(t, x) \in \mathbb{R}_{+}^{*} \times \mathbb{R}\right)$ is called a random field solution to (1.5) if the following four conditions are satisfied:
(1) $u$ is adapted, i.e., for all $(t, x) \in \mathbb{R}_{+}^{*} \times \mathbb{R}, u(t, x)$ is $\mathcal{F}_{t}$-measurable;
(2) $u$ is jointly measurable with respect to $\mathcal{B}\left(\mathbb{R}_{+}^{*} \times \mathbb{R}\right) \times \mathcal{F}$;
(3) $\left(G_{v}^{2} \star\|\rho(u)\|_{2}^{2}\right)(t, x)<+\infty$ for all $(t, x) \in \mathbb{R}_{+}^{*} \times \mathbb{R}$, and the function $(t, x) \mapsto$ $I(t, x)$ mapping $\mathbb{R}_{+}^{*} \times \mathbb{R}$ into $L^{2}(\Omega)$ is continuous;
(4) $u$ satisfies (1.5) a.s., for all $(t, x) \in \mathbb{R}_{+}^{*} \times \mathbb{R}$.

Assume that $\rho: \mathbb{R} \mapsto \mathbb{R}$ is globally Lipschitz continuous with Lipschitz constant $\operatorname{Lip}_{\rho}>0$. We consider the following growth conditions on $\rho$ : for some constants $\mathrm{L}_{\rho}>0$ and $\bar{\varsigma} \geq 0$,

$$
\begin{equation*}
|\rho(x)|^{2} \leq \mathrm{L}_{\rho}^{2}\left(\bar{\varsigma}^{2}+x^{2}\right), \quad \text { for all } x \in \mathbb{R} \tag{2.1}
\end{equation*}
$$

Note that $\mathrm{L}_{\rho} \leq \sqrt{2} \mathrm{Lip}_{\rho}$, and the inequality may be strict. Of particular importance is the linear case (the parabolic Anderson model): $\rho(u)=\lambda u$ with $\lambda \neq 0$, which is a special case of the following quasi-linear growth condition: for some constant $\varsigma \geq 0$,

$$
\begin{equation*}
|\rho(x)|^{2}=\lambda^{2}\left(\varsigma^{2}+x^{2}\right), \quad \text { for all } x \in \mathbb{R} \tag{2.2}
\end{equation*}
$$

Define the kernel functions:

$$
\begin{gather*}
\mathcal{K}(t, x)=\mathcal{K}(t, x ; v, \lambda):=G_{\frac{v}{2}}(t, x)\left(\frac{\lambda^{2}}{\sqrt{4 \pi v t}}+\frac{\lambda^{4}}{2 v} e^{\frac{\lambda^{4} t}{4 v}} \Phi\left(\lambda^{2} \sqrt{\frac{t}{2 v}}\right)\right),  \tag{2.3}\\
\mathcal{H}(t)=\mathcal{H}(t ; v, \lambda):=(1 \star \mathcal{K})(t, x)=2 e^{\frac{\lambda^{4} t}{4 v}} \Phi\left(\lambda^{2} \sqrt{\frac{t}{2 v}}\right)-1 \tag{2.4}
\end{gather*}
$$

where $\Phi(x)=\int_{-\infty}^{x}(2 \pi)^{-1 / 2} e^{-y^{2} / 2} \mathrm{~d} y$, and the formula on the right-hand side is explained in $[5,(2.18)]$. Some functions related to $\Phi(x)$ are the error functions $\operatorname{erf}(x)=$ $\frac{2}{\sqrt{\pi}} \int_{0}^{x} e^{-y^{2}} \mathrm{~d} y$ and $\operatorname{erfc}(x)=1-\operatorname{erf}(x)$. Clearly, $\Phi(x)=(1+\operatorname{erf}(x / \sqrt{2})) / 2$.

Let $z_{p}$ be the universal constant in the Burkholder-Davis-Gundy inequality (see [8, Theorem 1.4], in particular, $z_{2}=1$ ) which satisfies $z_{p} \leq 2 \sqrt{p}$ for all $p \geq 2$. Let $a_{p, \bar{\zeta}}$ be the constant defined by

$$
a_{p, \bar{\zeta}}:= \begin{cases}2^{(p-1) / p} & \text { if } \bar{\zeta} \neq 0, p>2, \\ \sqrt{2} & \text { if } \bar{\zeta}=0, p>2, \\ 1 & \text { if } p=2\end{cases}
$$

Notice that $a_{p, \bar{\varsigma}} \in[1,2]$. Denote $\overline{\mathcal{K}}(t, x):=\mathcal{K}\left(t, x ; v, \mathrm{~L}_{\rho}\right), \widehat{\mathcal{K}}_{p}(t, x)=\mathcal{K}(t, x ;$ $\left.v, a_{p, \bar{\zeta}} z_{p} \mathrm{~L}_{\rho}\right)$ and $\overline{\mathcal{H}}(t):=\mathcal{H}\left(t ; v, \mathrm{~L}_{\rho}\right), \widehat{\mathcal{H}}_{p}(t)=\mathcal{H}\left(t ; v, a_{p, \bar{\varsigma}} z_{p} \mathrm{~L}_{\rho}\right)$.

The following theorem is mostly taken from [5, Theorem 2.4], except that (2.7) comes from [5, Corollary 2.8].

Theorem 2.2 (Existence, uniqueness and moments) Suppose that the function $\rho$ is Lipschitz continuous and satisfies (2.1), and $\mu \in \mathcal{M}_{H}(\mathbb{R})$. Then the stochastic integral equation (1.5) has a random field solution $u=\left\{u(t, x),(t, x) \in \mathbb{R}_{+}^{*} \times \mathbb{R}\right\}$. Moreover:
(1) $u$ is unique (in the sense of versions).
(2) $(t, x) \mapsto u(t, x)$ is $L^{p}(\Omega)$-continuous for all integers $p \geq 2$.
(3) For all even integers $p \geq 2$, all $t>0$ and $x, y \in \mathbb{R}$,

$$
\|u(t, x)\|_{p}^{2} \leq \begin{cases}J_{0}^{2}(t, x)+\left(J_{0}^{2} \star \overline{\mathcal{K}}\right)(t, x)+\bar{\varsigma}^{2} \overline{\mathcal{H}}(t), & \text { if } p=2,  \tag{2.5}\\ 2 J_{0}^{2}(t, x)+\left(2 J_{0}^{2} \star \widehat{\mathcal{K}}_{p}\right)(t, x)+\bar{\varsigma}^{2} \widehat{\mathcal{H}}_{p}(t), & \text { if } p>2\end{cases}
$$

(4) In particular, if $|\rho(u)|^{2}=\lambda^{2}\left(\varsigma^{2}+u^{2}\right)$, then for all $t>0$ and $x, y \in \mathbb{R}$,

$$
\begin{equation*}
\|u(t, x)\|_{2}^{2}=J_{0}^{2}(t, x)+\left(J_{0}^{2} \star \mathcal{K}\right)(t, x)+\varsigma^{2} \mathcal{H}(t) \tag{2.6}
\end{equation*}
$$

Moreover, if $\mu=\delta_{0}$ (the Dirac delta function), then

$$
\begin{equation*}
\|u(t, x)\|_{2}^{2}=\frac{1}{\lambda^{2}} \mathcal{K}(t, x)+\varsigma^{2} \mathcal{H}(t) \tag{2.7}
\end{equation*}
$$

The next lemma is classical. A proof can be found in [5, Lemma 3.8].
Lemma 2.3 The function $(t, x) \mapsto J_{0}(t, x)=\left(\mu * G_{v}(t, \cdot)\right)(x)$ with $\mu \in \mathcal{M}_{H}(\mathbb{R})$ is smooth for $t>0$ : $J_{0}(t, x) \in C^{\infty}\left(\mathbb{R}_{+}^{*} \times \mathbb{R}\right)$. If, in addition, $\mu(\mathrm{d} x)=f(x) \mathrm{d} x$ where $f$ is continuous, then $J_{0}$ is continuous up to $t=0: J_{0} \in C^{\infty}\left(\mathbb{R}_{+}^{*} \times \mathbb{R}\right) \cap C\left(\mathbb{R}_{+} \times \mathbb{R}\right)$, and if $f$ is $\alpha$-Hölder continuous, then $J_{0} \in C^{\infty}\left(\mathbb{R}_{+}^{*} \times \mathbb{R}\right) \cap C_{\alpha / 2, \alpha}\left(\mathbb{R}_{+} \times \mathbb{R}\right)$.

For $p \geq 2$ and $X \in L^{2}\left(\mathbb{R}_{+} \times \mathbb{R}, L^{p}(\Omega)\right)$, set

$$
\|X\|_{M, p}^{2}:=\iint_{\mathbb{R}_{+}^{*} \times \mathbb{R}}\|X(s, y)\|_{p}^{2} \mathrm{~d} s \mathrm{~d} y<+\infty .
$$

When $p=2$, we write $\|X\|_{M}$ instead of $\|X\|_{M, 2}$. In [28], $\iint X \mathrm{~d} W$ is defined for predictable $X$ such that $\|X\|_{M}<+\infty$. Let $\mathcal{P}_{p}$ denote the closure in $L^{2}\left(\mathbb{R}_{+} \times \mathbb{R}, L^{p}(\Omega)\right)$ of simple processes. Clearly, $\mathcal{P}_{2} \supseteq \mathcal{P}_{p} \supseteq \mathcal{P}_{q}$ for $2 \leq p \leq q<+\infty$, and according to Itô's isometry, $\iint X \mathrm{~d} W$ is well-defined for all elements of $\mathcal{P}_{2}$. The next lemma, taken from [5, Lemma 3.3], gives easily verifiable conditions for checking that $X \in \mathcal{P}_{2}$. In the following, we will use $\cdot$ and $\circ$ to denote the time and space dummy variables respectively.

Lemma 2.4 Let $\mathcal{G}(s, y)$ be a deterministic measurable function from $\mathbb{R}_{+}^{*} \times \mathbb{R}$ to $\mathbb{R}$ and let $Z=\left(Z(s, y),(s, y) \in \mathbb{R}_{+}^{*} \times \mathbb{R}\right)$ be a process with the following properties:
(1) $Z$ is adapted and jointly measurable with respect to $\mathcal{B}\left(\mathbb{R}^{2}\right) \times \mathcal{F}$;
(2) $\mathbb{E}\left[\iint_{[0, t] \times \mathbb{R}} \mathcal{G}^{2}(t-s, x-y) Z^{2}(s, y) \mathrm{d} s \mathrm{~d} y\right]<\infty$, for all $(t, x) \in \mathbb{R}_{+} \times \mathbb{R}$.

Then for each $(t, x) \in \mathbb{R}_{+} \times \mathbb{R}$, the random field $\left.(s, y) \in\right] 0, t[\times \mathbb{R} \mapsto$ $\mathcal{G}(t-s, x-y) Z(s, y)$ belongs to $\mathcal{P}_{2}$ and so the stochastic convolution

$$
(\mathcal{G} \star Z \dot{W})(t, x):=\iint_{[0, t] \times \mathbb{R}} \mathcal{G}(t-s, x-y) Z(s, y) W(\mathrm{~d} s, \mathrm{~d} y)
$$

is a well-defined Walsh integral and the random field $\mathcal{G} \star Z \dot{W}$ is adapted. Moreover, for all even integers $p \geq 2$ and $(t, x) \in \mathbb{R}_{+} \times \mathbb{R}$,

$$
\|(\mathcal{G} \star Z \dot{W})(t, x)\|_{p}^{2} \leq z_{p}^{2}\|\mathcal{G}(t-\cdot, x-\circ) Z(\cdot, \circ)\|_{M, p}^{2}
$$

## 3 Main results

If the initial data is of the form $\mu(\mathrm{d} x)=f(x) \mathrm{d} x$, where $f$ is a bounded function, then it is well-known (see [28]) that the solution $u$ is bounded in $L^{p}(\Omega)$ for all $p \geq 2$. In addition, by the moment formula (2.5),

$$
\begin{equation*}
\sup _{(t, x) \in[0, T] \times \mathbb{R}}\|u(t, x)\|_{p}^{2} \leq 2 C^{2}+\left(2 C^{2}+\bar{\varsigma}^{2}\right) \widehat{\mathcal{H}}_{p}(T)<+\infty, \quad \text { for all } T>0, \tag{3.1}
\end{equation*}
$$

where $C=\sup _{x \in \mathbb{R}}|f(x)|=\sup _{(t, x) \in \mathbb{R}_{+} \times \mathbb{R}} J_{0}(t, x)$. From this bound, one can easily derive that that $u \in C_{1 / 4-, 1 / 2-}\left(\mathbb{R}_{+}^{*} \times \mathbb{R}\right)$, a.s.: see Remark 4.6 below. We will extend this classical result to the case where $\mu$ can be unbounded either locally, such as $\mu=\delta_{0}$, or at $\pm \infty$, such as $\left.\mu(\mathrm{d} x)=e^{|x|^{a}} \mathrm{~d} x, a \in\right] 1,2[$, or both. However, for irregular initial conditions, Hölder continuity of $u$ will be obtained only on $\mathbb{R}_{+}^{*} \times \mathbb{R}$, and this continuity extends to $\mathbb{R}_{+} \times \mathbb{R}$ when the initial condition is continuous.

We need a set of initial data defined as follows:

$$
\mathcal{M}_{H}^{*}(\mathbb{R}):=\{\mu(\mathrm{d} x)=f(x) \mathrm{d} x, \text { s.t. } \exists a \in] 1,2\left[, \sup _{x \in \mathbb{R}}|f(x)| e^{-|x|^{a}}<+\infty\right\}
$$

Clearly, $\mathcal{M}_{H}^{*}(\mathbb{R}) \subset \mathcal{M}_{H}(\mathbb{R})$, and $\mathcal{M}_{H}^{*}(\mathbb{R})$ includes all absolutely continuous measures whose density functions are bounded by functions of the type $c_{1} e^{c_{2}|x|^{a}}$ with $c_{1}, c_{2}>0$ and $\left.a \in\right] 1,2[$ (see Lemma 5.1).

Theorem 3.1 Suppose that $\rho$ is Lipschitz continuous. Then the solution $u(t, x)=$ $J_{0}(t, x)+I(t, x)$ to (1.5) has the following sample path regularity:
(1) If $\mu \in \mathcal{M}_{H}(\mathbb{R})$, then $I \in C_{\frac{1}{4}-, \frac{1}{2}-}\left(\mathbb{R}_{+}^{*} \times \mathbb{R}\right)$ a.s. Therefore,

$$
u=J_{0}+I \in C_{\frac{1}{4}-, \frac{1}{2}-}\left(\mathbb{R}_{+}^{*} \times \mathbb{R}\right), \quad \text { a.s. }
$$

(2) If $\mu \in \mathcal{M}_{H}^{*}(\mathbb{R})$, then $I \in C_{\frac{1}{4}-, \frac{1}{2}-}\left(\mathbb{R}_{+} \times \mathbb{R}\right)$, a.s. If, in addition, $\mu(\mathrm{d} x)=f(x) \mathrm{d} x$, where $f$ is a continuous function, then

$$
u \in C\left(\mathbb{R}_{+} \times \mathbb{R}\right) \cap C_{\frac{1}{4}-, \frac{1}{2}-}\left(\mathbb{R}_{+}^{*} \times \mathbb{R}\right), \quad \text { a.s. }
$$

If $\mu \in \mathcal{M}_{H}^{*}(\mathbb{R})$ and, in addition, $\mu(\mathrm{d} x)=f(x) \mathrm{d} x$, where $f$ is an $\alpha$-Hölder continuous function, then

$$
u \in C_{\left(\frac{\alpha}{2} \wedge \frac{1}{4}\right)-,\left(\alpha \wedge \frac{1}{2}\right)-}\left(\mathbb{R}_{+} \times \mathbb{R}\right) \cap C_{\frac{1}{4}-, \frac{1}{2}-}\left(\mathbb{R}_{+}^{*} \times \mathbb{R}\right), \quad \text { a.s. }
$$

This theorem will be proved in Sect. 4.2.
Remark 3.2 The standard approach (e.g., that is used in [9], [10, p. $54-55]$, [24,26] and [28]) for proving Hölder continuity cannot be used to establish the above theorem. For instance, consider the case where $\rho(u)=u$ and $\mu=\delta_{0}$. The classical argument, as presented in [26, p. 432] (see also the proof of Proposition 1.5 in [1] and the proof of Corollary 3.4 in [28]), uses Burkholder's inequality for $p>1$ and Hölder's inequality with $q=p /(p-1)$ to obtain

$$
\begin{aligned}
\left\|I(t, x)-I\left(t^{\prime}, x^{\prime}\right)\right\|_{2 p}^{2 p} \leq & C_{p, T}\left(\int_{0}^{t \vee t^{\prime}} \int\right. \\
& \left.\mathrm{R} s \mathrm{~d} y\left(G_{v}(t-s, x-y)-G\left(t^{\prime}-s, x^{\prime}-y^{\prime}\right)\right)^{2}\right)^{p / q} \\
& \times \int_{0}^{t \vee t^{\prime}} \int \mathrm{d} s \mathrm{~d} y\left(G_{v}(t-s, x-y)-G\left(t^{\prime}-s, x^{\prime}-y^{\prime}\right)\right)^{2} \\
& \times\left(1+\|u(s, y)\|_{2 p}^{2 p}\right) .
\end{aligned}
$$

However, by Hölder's inequality, (2.7) and (2.3),

$$
\|u(s, y)\|_{2 p}^{2} \geq\|u(s, y)\|_{2}^{2} \geq G_{\nu / 2}(s, y) \frac{1}{\sqrt{4 \pi v s}}
$$

Therefore, $\|u(s, y)\|_{2 p}^{2 p} \geq C G_{\nu /(2 p)}(s, y) s^{1 / 2-p}$. The second term in the above bound is not $\mathrm{d} s$-integrable in a neighborhood of $\{0\} \times \mathbb{R}$ unless $p<3 / 2$. Therefore, this classical argument does not apply in the presence of an irregular initial condition such as $\delta_{0}$.

Example 3.3 (Dirac delta initial data) Suppose $\rho(u)=\lambda u$ with $\lambda \neq 0$. If $\mu=\delta_{0}$, then neither $x \mapsto J_{0}(0, x)$ nor $x \mapsto \lim _{t \rightarrow 0_{+}}\|I(t, x)\|_{2}$ is a continuous function. Indeed, this is clear for $J_{0}(0, x)=\delta_{0}(x)$. For $\lim _{t \rightarrow 0_{+}}\|I(t, x)\|_{2}$, by (2.7),

$$
\|I(t, x)\|_{2}^{2}=\|u(t, x)\|_{2}^{2}-J_{0}^{2}(t, x)=\frac{\lambda^{2}}{2 v} e^{\frac{\lambda^{4} t}{4 v}} \Phi\left(\lambda^{2} \sqrt{\frac{t}{2 v}}\right) G_{\nu / 2}(t, x)
$$

Therefore, $\lim _{t \rightarrow 0_{+}}\|I(t, x)\|_{2}^{2}$ equals 0 if $x \neq 0$, and $+\infty$ if $x=0$. (We note that $I(0, x) \equiv 0$ by definition).

Example 3.3 suggests that $\|I(t, x)\|_{2}^{2}$ tends to $\frac{\lambda^{2}}{4 \nu} \delta_{0}(x)$ as $t \rightarrow 0_{+}$in the weak sense, i.e.,

$$
\lim _{t \rightarrow 0_{+}}\left\langle\|I(t, \cdot)\|_{2}^{2}, \phi(\cdot)\right\rangle=\frac{\lambda^{2}}{4 v} \phi(0), \quad \text { for all } \phi \in C_{c}^{\infty}(\mathbb{R})
$$

where $C_{c}^{\infty}(\mathbb{R})$ denotes smooth functions with compact support. Furthermore, the following proposition shows that the random field solution of (1.5) satisfies the initial condition $u(0, \circ)=\mu$ in a weak sense.

Proposition 3.4 For all $\phi \in C_{c}^{\infty}(\mathbb{R})$ and $\mu \in \mathcal{M}_{H}(\mathbb{R})$,

$$
\lim _{t \rightarrow 0_{+}} \int_{\mathbb{R}} \mathrm{d} x u(t, x) \phi(x)=\int_{\mathbb{R}} \mu(\mathrm{d} x) \phi(x) \text { in } L^{2}(\Omega)
$$

The proof of this proposition is presented in Sect. 4.5. In the next proposition, rather than considering sample path continuity, we shows that the map $t \mapsto I(t, x)$, from $[0,1]$ into $L^{p}(\Omega, \mathcal{F}, P)$, may be quite far from $\frac{1}{4}$-Hölder continuous at the origin, and in fact, the Hölder-exponent may be arbitrarily near 0 .
Proposition 3.5 Suppose $\rho(u)=\lambda u$ with $\lambda \neq 0$ and $\mu(\mathrm{d} x)=|x|^{-a} \mathrm{~d} x$ with $0<$ $a \leq 1$, so that $J_{0}(0, x)=|x|^{-a}$ is not locally bounded. Fix $p \geq 2$. Then:
(1) If $a<1 / 2$, then for all $x \in \mathbb{R}, \lim _{t \rightarrow 0_{+}}\|I(t, x)\|_{p} \equiv 0$.
(2) There is $c>0$ such that for all $t>0,\|I(t, 0)\|_{p} \geq c t^{\frac{1-2 a}{4}}$.

In particular, when $\frac{1}{2}<a<1, \lim _{t \rightarrow 0_{+}}\|I(t, 0)\|_{p}=+\infty$, and when $0<a<\frac{1}{2}$,
 this case $\left.\frac{1-2 a}{4} \in\right] 0,1 / 4[$ ).
Proof (1) By the moment bounds formulas (2.5) and (2.6), it suffices to consider second moment and show that $\lim _{t \rightarrow 0_{+}}\|I(t, x)\|_{2} \equiv 0$. For some constant $C_{a}>0$, the Fourier transform of $\mu$ is $C_{a}|x|^{-1+a}$ (see [27, Lemma 2 (a), p. 117]), which is non-negative. Hence Bochner's theorem (see, e.g., [15, Theorem 1, p. 152]) implies that $\mu$, and therefore $x \mapsto J_{0}(t, x)$, is non-negative definite. Such functions achieves their maximum at the origin (see, e.g., [15, Theorem 1, p. 152]), and so

$$
0<J_{0}(t, x) \leq J_{0}(t, 0)=\int_{\mathbb{R}} \mathrm{d} y \frac{1}{|y|^{a}} G_{\nu}(t, y)=2 \int_{0}^{+\infty} \mathrm{d} y \frac{e^{-y^{2} /(2 v t)}}{y^{a} \sqrt{2 \pi \nu t}}
$$

Then by a change of variable and using Euler's integral (see [19, 5.2.1, p.136]),

$$
\begin{equation*}
J_{0}(t, 0)=2 \int_{0}^{+\infty} \mathrm{d} u \frac{e^{-u}}{(2 v t u)^{a / 2} \sqrt{2 \pi v t}} \frac{\sqrt{2 v t}}{2 \sqrt{u}}=\frac{\Gamma\left(\frac{1-a}{2}\right)}{\sqrt{\pi}(2 v t)^{a / 2}}, \tag{3.2}
\end{equation*}
$$

where $\Gamma(x)$ is Euler's Gamma function [19]. By (2.6) and the above bound,

$$
\|I(t, x)\|_{2}^{2}=\left(J_{0}^{2} \star \mathcal{K}\right)(t, x) \leq \int_{0}^{t} \mathrm{~d} s\left(\frac{\lambda^{2}}{\sqrt{4 \pi v(t-s)}}+\frac{\lambda^{4}}{2 v} e^{\frac{\lambda^{4}(t-s)}{4 v}}\right) \frac{C}{s^{a}}
$$

The integral converges if and only if $a<1$. Finally, using the Beta integral (see [19, (5.12.1), p. 142])

$$
\begin{equation*}
\int_{0}^{t} \mathrm{~d} s s^{\mu-1}(t-s)^{v-1}=t^{\mu+v-1} \frac{\Gamma(\mu) \Gamma(v)}{\Gamma(\mu+v)}, \quad \text { for } t>0, \mu>0 \text { and } v>0 \tag{3.3}
\end{equation*}
$$

we see that $\|I(t, x)\|_{2}^{2} \leq C_{1} t^{1 / 2-a}+C_{2} t^{1-a}$, so $\lim _{t \rightarrow 0_{+}}\|I(t, x)\|_{2}^{2}=0$ when $a<1 / 2$.
(2) Now consider the function $t \mapsto I(t, 0)$ from $\mathbb{R}_{+}$to $L^{p}(\Omega)$. Since $(x-y)^{2} \leq$ $2\left(x^{2}+y^{2}\right)$, as in (3.2), we see that

$$
J_{0}(t, x)=\int_{\mathbb{R}} \mathrm{d} y \frac{1}{|y|^{a}} G_{v}(t, x-y) \geq \frac{1}{\sqrt{2}} \exp \left(-\frac{x^{2}}{\nu t}\right) \frac{\Gamma\left(\frac{1-a}{2}\right)}{\sqrt{\pi}} \frac{1}{(\nu t)^{a / 2}}
$$

Hence,

$$
J_{0}^{2}(t, x) \geq C G_{\nu / 2}\left(\frac{t}{2}, x\right) t^{1 / 2-a}
$$

Since $\mathcal{K}(t, x) \geq G_{\nu / 2}(t, x) \frac{\lambda^{2}}{\sqrt{4 \pi \nu t}}$ by (2.3),

$$
\|I(t, x)\|_{2}^{2} \geq \frac{C^{\prime} \exp \left(-\frac{2 x^{2}}{v t}\right)}{t} \int_{0}^{t} \mathrm{~d} s s^{1 / 2-a}=C^{\prime \prime} \exp \left(-\frac{2 x^{2}}{v t}\right) t^{\frac{1-2 a}{2}}
$$

If $x=0$, then for all integers $p \geq 2$, since $I(0, x) \equiv 0$,

$$
\|I(t, 0)-I(0,0)\|_{p}^{2} \geq\|I(t, 0)\|_{2}^{2} \geq C^{\prime \prime} t^{\frac{1-2 a}{2}}
$$

When $0<a<1 / 2$, the function $t \mapsto I(t, 0)$ from $\mathbb{R}_{+}$to $L^{p}(\Omega)$ cannot be smoother than $\eta$-Hölder continuous at $t=0$ with $\left.\eta=\frac{1-2 a}{4} \in\right] 0,1 / 4[$.

## 4 Proofs of the main results

Establishing Hölder continuity relies on Kolmogorov's continuity theorem. We present a formulation of this result that is suitable for our purposes.
4.1 Kolmogorov's continuity theorem

For $x=\left(x_{1}, \ldots, x_{N}\right)$ and $y=\left(y_{1}, \ldots, y_{N}\right)$, define

$$
\begin{equation*}
\left.\left.\tau_{\alpha_{1}, \ldots, \alpha_{N}}(x, y):=\sum_{i=1}^{N}\left|x_{i}-y_{i}\right|^{\alpha_{i}}, \quad \text { with } \alpha_{1}, \ldots, \alpha_{N} \in\right] 0,1\right] . \tag{4.1}
\end{equation*}
$$

This defines a metric on $\mathbb{R}^{N}$ that is not induced by a norm except when $\alpha_{i}=1$ for $i=1, \ldots, N$. We refer the interested readers to [16, Theorem 4.3] or [22, Theorem 2.1, on p. 62] for the isotropic case $\left(\alpha_{1}=\cdots=\alpha_{N}\right)$. For the anisotropic case (where the $\alpha_{i}$ are not identical), see [17, Theorem 1.4.1, p. 31] and [11, Corollary A.3, p. 34]. We state a version (Proposition 4.2 below), which is a consequence of these references and is convenient for our purposes.

Definition 4.1 (Hölder continuity) A function $f: D \mapsto \mathbb{R}$ with $D \subseteq \mathbb{R}^{N}$ is said to be locally (and uniformly) Hölder continuous with indices $\left(\alpha_{1}, \ldots, \alpha_{N}\right)$ if for all compact sets $K \subseteq D$, there exists a constant $A_{K}$ such that for all $x, y \in K$, $|f(x)-f(y)| \leq A_{K} \sum_{i=1}^{N}\left|x_{i}-y_{i}\right|^{\alpha_{i}}$.

Proposition 4.2 Let $\left\{X(t, x):(t, x) \in \mathbb{R}_{+} \times \mathbb{R}^{d}\right\}$ be a random field indexed by $\mathbb{R}_{+} \times \mathbb{R}^{d}$. Suppose that there exist $d+1$ constants $\left.\left.\alpha_{i} \in\right] 0,1\right], i=0,1, \ldots, d$, and $p>\sum_{i=0}^{d} \alpha_{i}^{-1}$ such that, for all $n>1$, there is a constant $C_{p, n}$ such that

$$
\|X(t, x)-X(s, y)\|_{p} \leq C_{p, n} \tau_{\alpha_{0}, \ldots, \alpha_{d}}((t, x),(s, y)),
$$

for all $(t, x)$ and $(s, y)$ in $K_{n}:=[1 / n, n] \times[-n, n]^{d}$, where the metric $\tau_{\alpha_{0}, \ldots, \alpha_{d}}$ is defined in (4.1) with $N=d+1$. Then $X$ has a modification which is locally Hölder continuous in $\mathbb{R}_{+}^{*} \times \mathbb{R}^{d}$ with indices $\left(\beta \alpha_{0}, \ldots, \beta \alpha_{d}\right)$, for all $\left.\beta \in\right] 0, \beta_{p}[$, where $\beta_{p}=1-p^{-1} \sum_{i=0}^{d} \alpha_{i}^{-1}$. In addition, for all $0 \leq \beta<\beta_{p}$,

$$
E\left[\left(\sup _{\substack{(t, x),(s, y) \in K_{n} \\(t, x) \neq(s, y)}} \frac{|X(t, x)-X(s, y)|}{\left[\tau_{\alpha_{0}, \ldots, \alpha_{d}}((t, x),(s, y))\right]^{\beta}}\right)^{p}\right]<+\infty .
$$

If the compact sets $K_{n}$ can be taken to be $[0, n] \times[-n, n]^{d}$, then the same local Hölder continuity of $X$ extends to $\mathbb{R}_{+} \times \mathbb{R}^{d}$ and the moment bound on increments of $X$ applies with this new $K_{n}$.

### 4.2 Moment estimates

The main moment estimate that is needed for this proof is the following.
Proposition 4.3 Fix $\bar{\varsigma} \in \mathbb{R}$ and $\mu \in \mathcal{M}_{H}(\mathbb{R})$.
(1) For all $p \geq 2$ and $n>1$, there is a constant $C_{n, p}$ such that for all $t, t^{\prime} \in[1 / n, n]$ and $x, x^{\prime} \in[-n, n]$,

$$
\begin{equation*}
\left\|I(t, x)-I\left(t^{\prime}, x^{\prime}\right)\right\|_{p} \leq C_{n, p}\left(\left|t-t^{\prime}\right|^{\frac{1}{4}}+\left|x-x^{\prime}\right|^{\frac{1}{2}}\right) . \tag{4.2}
\end{equation*}
$$

(2) If, in addition, $\mu \in \mathcal{M}_{H}^{*}(\mathbb{R})$, then there exists a constant $C_{n, p}^{*}$ such that for all $(t, x),\left(t^{\prime}, x^{\prime}\right) \in[0, n] \times[-n, n]$, (4.2) holds with $C_{n, p}$ replaced by $C_{n, p}^{*}$.

The proof of this proposition will be given at the end of this section. We note that by Proposition 3.5, the conclusion in part (2) above is not valid for all $\mu \in \mathcal{M}_{H}(\mathbb{R})$.

Assuming Proposition 4.3, we now prove Theorem 3.1.
Proof of Theorem 3.1 By Lemma 2.3, we only need to establish the Hölder-continuity statements for $I$ instead of $u$. Part (1) (respectively (2)) follows from Proposition 4.3(1) (respectively Proposition 4.3(2)) and Proposition 4.2. This proves Theorem 3.1.

The next two propositions are needed to establish Proposition 4.3.
Proposition 4.4 Given $\bar{\zeta} \in \mathbb{R}$ and $\mu \in \mathcal{M}_{H}(\mathbb{R})$, let $J_{0}^{*}(t, x)=\left(|\mu| * G_{\nu}(t, \cdot)\right)(x)$ and $h(t, x)=\bar{\varsigma}^{2}+2\left[J_{0}^{*}(t, x)\right]^{2}$. Then we have:
(1) For all $n>1$, there exist constants $C_{n, i}, i=1,3,5$, such that for all $t, t^{\prime} \in$ $[1 / n, n]$, with $t<t^{\prime}$, and $x, x^{\prime} \in[-n, n]$,

$$
\begin{align*}
& \iint_{[0, t] \times \mathbb{R}} \mathrm{d} s \mathrm{~d} y h(s, y)\left(G_{v}(t-s, x-y)-G_{\nu}\left(t^{\prime}-s, x-y\right)\right)^{2} \leq C_{n, 1} \sqrt{t^{\prime}-t},  \tag{4.3}\\
& \iint_{[0, t] \times \mathbb{R}} \mathrm{d} s \mathrm{~d} y h(s, y)\left(G_{v}(t-s, x-y)-G_{v}\left(t-s, x^{\prime}-y\right)\right)^{2} \leq C_{n, 3}\left|x-x^{\prime}\right|, \tag{4.4}
\end{align*}
$$

$$
\begin{equation*}
\iint_{\left[t, t^{\prime}\right] \times \mathbb{R}} \mathrm{d} s \mathrm{~d} y h(s, y) G_{v}^{2}\left(t^{\prime}-s, x^{\prime}-y\right) \leq C_{n, 5} \sqrt{t^{\prime}-t} . \tag{4.5}
\end{equation*}
$$

(2) If, in addition, $\mu \in \mathcal{M}_{H}^{*}(\mathbb{R})$, then there exist constants $C_{n, i}^{*}, i=1,3,5$, such that for all $(t, x),\left(t^{\prime}, x^{\prime}\right) \in[0, n] \times[-n, n]$, (4.3)-(4.5) hold with $C_{n, i}$ replaced by $C_{n, i}^{*}, i=1,3,5$.

Proposition 4.5 Given $\bar{\zeta} \in \mathbb{R}$ and $\mu \in \mathcal{M}_{H}(\mathbb{R})$, let $J_{0}^{*}(t, x)=\left(|\mu| * G_{\nu}(t, \cdot)\right)(x)$. Then:
(1) For all $n>1$, there exist three constants

$$
\begin{equation*}
C_{n, 2}=\frac{\sqrt{\pi n}}{\sqrt{4 v}} C_{n, 1}, \quad C_{n, 4}=\frac{\sqrt{\pi n}}{\sqrt{4 v}} C_{n, 3}, \quad \text { and } \quad C_{n, 6}=\frac{\sqrt{\pi n}}{\sqrt{4 v}} C_{n, 5}, \tag{4.6}
\end{equation*}
$$

such that for all $t, t^{\prime} \in[1 / n, n]$ with $t<t^{\prime}$ and $x, x^{\prime} \in[-n, n]$,

$$
\begin{align*}
& \left|\left(\left(\bar{\zeta}^{2}+2\left|J_{0}^{*}\right|^{2}\right) \star G_{v}^{2} \star\left(G_{v}(\cdot, \circ)-G_{v}\left(\cdot+t^{\prime}-t, \circ\right)\right)^{2}\right)(t, x)\right| \leq C_{n, 2} \sqrt{t^{\prime}-t}  \tag{4.7}\\
& \left|\left(\left(\bar{\varsigma}^{2}+2\left|J_{0}^{*}\right|^{2}\right) \star G_{v}^{2} \star\left(G_{v}(\cdot, \circ)-G_{\nu}\left(\cdot, \circ+x^{\prime}-x\right)\right)^{2}\right)(t, x)\right| \leq C_{n, 4}\left|x^{\prime}-x\right|  \tag{4.8}\\
& \iint_{\left[t, t^{\prime}\right] \times \mathbb{R}} \mathrm{d} s \mathrm{~d} y\left(\left(\bar{\varsigma}^{2}+2\left|J_{0}^{*}\right|^{2}\right) \star G_{v}^{2}\right)(s, y) G_{v}^{2}\left(t^{\prime}-s, x^{\prime}-y\right) \leq C_{n, 6} \sqrt{t^{\prime}-t} . \tag{4.9}
\end{align*}
$$

(2) If, in addition, $\mu \in \mathcal{M}_{H}^{*}(\mathbb{R})$, then there exist constants

$$
C_{n, 2}^{*}=\frac{\sqrt{n}}{\sqrt{\pi \nu}} C_{n, 1}^{*}, \quad C_{n, 4}^{*}=\frac{\sqrt{n}}{\sqrt{\pi \nu}} C_{n, 3}^{*}, \quad \text { and } \quad C_{n, 6}^{*}=\frac{\sqrt{n}}{\sqrt{\pi \nu}} C_{n, 5}^{*},
$$

such that for all $(t, x),\left(t^{\prime}, x^{\prime}\right) \in[0, n] \times[-n, n]$, (4.7)-(4.9) hold with $C_{n, i}$ replaced by $C_{n, i}^{*}, i=2,4,6$.

The proofs of these two propositions are given in the Sects. 4.3 and 4.4. Assuming Propositions 4.4 and 4.5, we now prove Proposition 4.3.

Proof of Proposition 4.3 We first prove part (1). Without loss of generality, assume that $\mu \geq 0$. Otherwise, we simply replace $\mu$ in the following arguments by $|\mu|$. Fix $n>1$. By parts (1) of Propositions 4.4 and 4.5 , there exist $C_{n, i}>0$ for $i=1, \ldots, 6$ such that for all $(t, x)$ and $\left(t^{\prime}, x^{\prime}\right) \in[1 / n, n] \times[-n, n]$ with $t^{\prime}>t$, the six inequalities in Propositions 4.4 and 4.5 hold. By (2.1) and Lemma 2.4, for all even integers $p \geq 2$,

$$
\left\|I(t, x)-I\left(t^{\prime}, x^{\prime}\right)\right\|_{p}^{p} \leq 2^{p-1} z_{p}^{p} \mathrm{~L}_{\rho}^{p} I_{1}\left(t, t^{\prime}, x, x^{\prime}\right)^{p / 2}+2^{p-1} z_{p}^{p} \mathrm{~L}_{\rho}^{p} I_{2}\left(t, t^{\prime} ; x^{\prime}\right)^{p / 2},
$$

where

$$
\begin{align*}
I_{1}\left(t, t^{\prime}, x, x^{\prime}\right)= & \iint_{[0, t] \times \mathbb{R}} \mathrm{d} s \mathrm{~d} y\left(G_{v}(t-s, x-y)-G_{v}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2} \\
& \times\left[\bar{\zeta}^{2}+\|u(s, y)\|_{p}^{2}\right],  \tag{4.10}\\
I_{2}\left(t, t^{\prime} ; x^{\prime}\right)= & \iint_{\left[t, t^{\prime}\right] \times \mathbb{R}} \mathrm{d} s \mathrm{~d} y G_{v}^{2}\left(t^{\prime}-s, x^{\prime}-y\right)\left(\bar{\zeta}^{2}+\|u(s, y)\|_{p}^{2}\right) . \tag{4.11}
\end{align*}
$$

By the subadditivity of $x \mapsto|x|^{2 / p}$ and since $2^{2(p-1) / p} \leq 4$,

$$
\left\|I(t, x)-I\left(t^{\prime}, x^{\prime}\right)\right\|_{p}^{2} \leq 4 z_{p}^{2} \mathrm{~L}_{\rho}^{2}\left[I_{1}\left(t, t^{\prime}, x, x^{\prime}\right)+I_{2}\left(t, t^{\prime} ; x^{\prime}\right)\right]
$$

Notice that

$$
\mathcal{K}(t, x ; v, \lambda)=\Upsilon(t ; v, \lambda) G_{\nu}^{2}(t, x)
$$

with

$$
\Upsilon(t ; v, \lambda)=\lambda^{2}+\lambda^{4} \sqrt{\frac{\pi t}{v}} e^{\frac{\lambda^{4} t}{4 v}} \Phi\left(\lambda^{2} \sqrt{\frac{t}{2 v}}\right)
$$

Denote $\Upsilon_{*}(t):=\Upsilon\left(t ; v, a_{p, \bar{\varsigma}} z_{p} \mathrm{~L}_{\rho}\right)<+\infty$, for all $t \in \mathbb{R}_{+}$. Clearly, $\Upsilon_{*}(t) \leq$ $\Upsilon_{*}(n)$ for $t \leq n$. Hence, it follows from (2.5) and (2.4) that

$$
\begin{equation*}
\|u(s, y)\|_{p}^{2} \leq 2 J_{0}^{2}(s, y)+\Upsilon_{*}(n)\left(\left(\bar{\varsigma}^{2}+2 J_{0}^{2}\right) \star G_{v}^{2}\right)(s, y), \quad \text { for } s \leq t \leq n . \tag{4.12}
\end{equation*}
$$

We shall use this bound in order to estimate $I_{1}$ and $I_{2}$.
We first consider the case where $x=x^{\prime}$. Set $h=t^{\prime}-t$. Then

$$
\begin{aligned}
I_{1}\left(t, t^{\prime}, x, x\right) \leq & \left(\left(\bar{\varsigma}^{2}+2 J_{0}^{2}\right) \star\left(G_{v}(\cdot, \circ)-G_{v}(\cdot+h, \circ)\right)^{2}\right)(t, x) \\
& +\Upsilon_{*}(n)\left(\left(\bar{\varsigma}^{2}+2 J_{0}^{2}\right) \star G_{v}^{2} \star\left(G_{v}(\cdot, \circ)-G_{v}(\cdot+h, \circ)\right)^{2}\right)(t, x)
\end{aligned}
$$

By parts (1) of Propositions 4.4 and 4.5,

$$
I_{1}\left(t, t^{\prime}, x, x\right) \leq\left(C_{n, 1}+\Upsilon_{*}(n) C_{n, 2}\right)|h|^{1 / 2} .
$$

Similarly, we have that

$$
I_{2}\left(t, t^{\prime} ; x^{\prime}\right) \leq\left(C_{n, 5}+\Upsilon_{*}(n) C_{n, 6}\right)|h|^{1 / 2}
$$

Hence, for all $x \in[-n, n]$ and $1 / n \leq t<t^{\prime} \leq n$,

$$
\begin{equation*}
\left\|I(t, x)-I\left(t^{\prime}, x\right)\right\|_{p}^{2} \leq 4 z_{p}^{2} \mathrm{~L}_{\rho}^{2}\left(C_{n, 1}+C_{n, 5}+\Upsilon_{*}(n)\left(C_{n, 2}+C_{n, 6}\right)\right)\left|t^{\prime}-t\right|^{1 / 2} \tag{4.13}
\end{equation*}
$$

Now consider the case where $t=t^{\prime} \geq 1 / n$. Denote $\zeta=x^{\prime}-x$. In this case, $I_{2}=0$. By (4.12) above and parts (1) of Propositions 4.4 and 4.5,

$$
\left\|I(t, x)-I\left(t, x^{\prime}\right)\right\|_{p}^{2} \leq 4 z_{p}^{2} \mathrm{~L}_{\rho}^{2}\left[C_{n, 3}+\Upsilon_{*}(n) C_{n, 4}\right]|\zeta|
$$

Combining this with (4.13), we see that

$$
\left\|I(t, x)-I\left(t^{\prime}, x^{\prime}\right)\right\|_{p}^{2} \leq \widetilde{C}_{p, n}\left(\left|t^{\prime}-t\right|^{1 / 2}+\left|x^{\prime}-x\right|\right)
$$

for all $1 / n \leq t<t^{\prime} \leq n, x, x^{\prime} \in[-n, n]$, where $\widetilde{C}_{p, n}$ is a finite constant. This proves (1).

The conclusion in part (2) can be proved in the same way by applying parts (2) of Propositions 4.4 and 4.5 below instead of parts (1). We simply replace all $C_{n, i}$ above by $C_{n, i}^{*}$ for $i=1, \ldots, 6$. The remaining statements follow immediately. This completes the proof of Proposition 4.3.

Remark 4.6 (Case of bounded initial data) In the case where the initial data is bounded: $\mu(\mathrm{d} x)=f(x) \mathrm{d} x$, where $f$ is a bounded function such that $|f(x)| \leq C$, the conclusions of Proposition 4.3 follow from the following standard (and much simpler) argument: By (3.1), for $0 \leq t \leq t^{\prime} \leq T$, and $x, x^{\prime} \in \mathbb{R}$

$$
I_{1}\left(t, t^{\prime}, x, x^{\prime}\right) \leq A_{T} \iint_{\left[0, t^{\prime}\right] \times \mathbb{R}} \mathrm{d} s \mathrm{~d} y\left(G_{v}(t-s, x-y)-G_{v}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2},
$$

where $I_{1}\left(t, t^{\prime}, x, x^{\prime}\right)$ is defined in (4.10) and $A_{T}$ is a finite constant. Then by Proposition 5.2, for some constant $C^{\prime}>0$ depending only on $\nu$,

$$
I_{1}\left(t, t^{\prime}, x, x^{\prime}\right) \leq A_{T} C^{\prime}\left(\left|x-x^{\prime}\right|+\sqrt{\left|t^{\prime}-t\right|}\right) .
$$

Similarly, $I_{2}\left(t, t^{\prime}, x, x^{\prime}\right)$, defined in (4.11), is bounded by $A_{T} C^{\prime} \sqrt{\left|t^{\prime}-t\right|}$ with the same constants $A_{T}$ and $C^{\prime}$. Therefore,

$$
\left\|I(t, x)-I\left(t^{\prime}, x^{\prime}\right)\right\|_{p}^{2} \leq 4 z_{p}^{2} A_{T} C^{\prime}\left(\left|x-x^{\prime}\right|+\left|t-t^{\prime}\right|^{1 / 2}\right)
$$

for all $0 \leq t \leq t \leq T$ and $x, x^{\prime} \in \mathbb{R}$. The Hölder continuity follows from Proposition 4.2.

### 4.3 Proofs of part (1) of the Propositions 4.4 and 4.5

Lemma 4.7 For all $L>0, \beta \in] 0,1[, t>0, x \in \mathbb{R}, v>0$, and $h$ with $|h| \leq \beta L$, we have that

$$
\begin{aligned}
& \left|G_{v}(t, x+h)-G_{v}(t, x)\right| \\
& \quad \leq|h|\left(\frac{C}{\sqrt{2 v t}}+\frac{1}{(1-\beta) L}\right) \\
& \quad \times\left[G_{\nu}(t, x)+e^{\frac{3 L^{2}}{2 v t}}\left\{G_{\nu}(t, x-2 L)+G_{\nu}(t, x+2 L)\right\}\right]
\end{aligned}
$$

and

$$
\begin{aligned}
& \left|G_{v}(t, x+h)+G_{v}(t, x-h)-2 G_{v}(t, x)\right| \\
& \quad \leq 2|h|\left(\frac{C}{\sqrt{2 v t}}+\frac{1}{(1-\beta) L}\right) \\
& \quad \times\left[G_{v}(t, x)+e^{\frac{3 L^{2}}{2 v t}}\left\{G_{v}(t, x-2 L)+G_{v}(t, x+2 L)\right\}\right]
\end{aligned}
$$

where $C:=\sup _{x \in \mathbb{R}} \frac{1}{|x|}\left|e^{-x^{2} / 2}-1\right| \approx 0.451256$.

Proof Fix $L>0$ and $\beta \in] 0,1[$. Assume that $|h| \leq \beta L$. Define

$$
\begin{aligned}
f(t, x, h) & =G_{v}(t, x+h)+G_{v}(t, x-h)-2 G_{v}(t, x), \\
I(t, x, h) & = \begin{cases}h^{-1} G_{v}^{-1}(t, x-L)\left[G_{v}(t, x+h)-G_{v}(t, x)\right] & \text { if } x \geq 0, \\
h^{-1} G_{v}^{-1}(t, x+L)\left[G_{v}(t, x+h)-G_{v}(t, x)\right] & \text { if } x \leq 0 .\end{cases}
\end{aligned}
$$

Clearly,

$$
\begin{equation*}
\left|\frac{f(t, x, h)}{h\left(G_{v}(t, x+L)+G_{\nu}(t, x-L)\right)}\right| \leq|I(t, x, h)|+|I(t, x,-h)| . \tag{4.14}
\end{equation*}
$$

We will bound $|I(t, x, h)|$ for $-\beta L \leq h \leq \beta L$. If $x \geq 0$, then

$$
I(t, x, h)=\frac{1}{h}\left(e^{-\frac{(x+h)^{2}}{2 v t}+\frac{(x-L)^{2}}{2 v t}}-e^{-\frac{x^{2}}{2 v t}+\frac{(x-L)^{2}}{2 v t}}\right),
$$

and so

$$
\frac{\partial}{\partial x} I(t, x, h)=-\frac{1}{\nu t} e^{-\frac{(x+h)^{2}}{2 v t}+\frac{(x-L)^{2}}{2 v t}}-\frac{L}{v t} I(t, x, h) .
$$

Hence,

$$
|I(t, x, h)| \leq \int_{0}^{x}(\nu t)^{-1} e^{-\frac{(y+h)^{2}}{2 v t}+\frac{(y-L)^{2}}{2 v t}} \mathrm{~d} y+\frac{L}{\nu t} \int_{0}^{x}|I(t, y, h)| \mathrm{d} y+|I(t, 0, h)| .
$$

Let $C$ be the constant defined in the proposition. Then

$$
|I(t, 0, h)| \leq \frac{C}{\sqrt{2 v t}} e^{\frac{L^{2}}{2 v t}}, \quad \text { for all } h \in \mathbb{R} .
$$

Since $|h| \leq \beta L$,

$$
\int_{0}^{x} \frac{1}{v t} e^{-\frac{(y+h)^{2}}{2 v t}+\frac{(y-L)^{2}}{2 v t}} \mathrm{~d} y \leq \int_{0}^{\infty} \frac{1}{\nu t} e^{-\frac{(y+h)^{2}}{2 v t}+\frac{(y-L)^{2}}{2 v t}} \mathrm{~d} y=\frac{e^{\frac{L^{2}-h^{2}}{2 v t}}}{L+h} \leq \frac{e^{\frac{L^{2}}{2 v t}}}{(1-\beta) L}
$$

Therefore,

$$
|I(t, x, h)| \leq C_{t, L, \beta}+\frac{L}{v t} \int_{0}^{x}|I(t, y, h)| \mathrm{d} y
$$

with

$$
C_{t, L, \beta}:=\left(\frac{C}{\sqrt{2 v t}}+\frac{1}{(1-\beta) L}\right) e^{\frac{L^{2}}{2 v t}} .
$$

Apply Bellman-Gronwall's lemma (see [18, Lemma 12.2.2]) to get

$$
|I(t, x, h)| \leq C_{t, L, \beta} e^{\frac{L x}{v t}}=C_{t, L, \beta} e^{\frac{L|x|}{v t}},
$$

and so, by definition of $I(t, x, h)$,

$$
\begin{equation*}
\left|G_{\nu}(t, x+h)-G_{\nu}(t, x)\right| \leq C_{t, L, \beta}|h|\left(G_{\nu}(t, x+L)+G_{\nu}(t, x-L)\right) e^{\frac{L|x|}{v t}} \tag{4.15}
\end{equation*}
$$

By symmetry, for $x \leq 0$, we get the same bound for $|I(t, x, h)|$. Hence, from (4.14),

$$
\begin{equation*}
|f(t, x, h)| \leq 2 C_{t, L, \beta}|h|\left(G_{\nu}(t, x+L)+G_{\nu}(t, x-L)\right) \exp \left(\frac{L|x|}{\nu t}\right) \tag{4.16}
\end{equation*}
$$

Finally, some calculations show that

$$
\begin{aligned}
& \left(G_{v}(t, x+L)+G_{v}(t, x-L)\right) e^{\frac{L|x|}{v t}} \\
& \quad=G_{\nu}(t, x) e^{-\frac{L^{2}}{2 v t}}+G_{\nu}(t, x-2 L) e^{\frac{3 L^{2}}{2 v t}} 1_{\{x \geq 0\}}+G_{v}(t, x+2 L) e^{\frac{3 L^{2}}{2 v t}} 1_{\{x \leq 0\}} \\
& \quad \leq G_{\nu}(t, x) e^{-\frac{L^{2}}{2 v t}}+\left(G_{\nu}(t, x-2 L)+G_{v}(t, x+2 L)\right) e^{\frac{3 L^{2}}{2 v t}}
\end{aligned}
$$

The desired conclusions now follow from (4.15) and (4.16).
Proof of Proposition 4.4 Assume that $\bar{\zeta}=0$. Set $\bar{z}=\left(z_{1}+z_{2}\right) / 2$. Set

$$
I\left(t, x ; t^{\prime}, x^{\prime}\right)=\iint_{[0, t] \times \mathbb{R}} \mathrm{d} s \mathrm{~d} y\left[J_{0}^{*}(s, y)\right]^{2}\left(G_{v}(t-s, x-y)-G_{v}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2}
$$

Write $\left[J_{0}^{*}(s, y)\right]^{2}$ as a double integral and then use Lemma 5.3 to get

$$
\begin{align*}
I\left(t, x ; t^{\prime}, x^{\prime}\right)= & \int_{0}^{t} \mathrm{~d} s \iint_{\mathbb{R}^{2}}|\mu|\left(\mathrm{d} z_{1}\right)|\mu|\left(\mathrm{d} z_{2}\right) G_{2 v}\left(s, z_{1}-z_{2}\right) \\
& \times \int_{\mathbb{R}} \mathrm{d} y G_{\nu / 2}(s, y-\bar{z})\left(G_{v}(t-s, x-y)-G_{v}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2} \tag{4.17}
\end{align*}
$$

In the following, we use $\int \mathrm{d} y G(G-G)^{2}$ to denote the $\mathrm{d} y$-integral in (4.17). Expand $(G-G)^{2}=G^{2}-2 G G+G^{2}$ and apply Lemma 5.3 to each term:

$$
\begin{aligned}
& \left(G_{\nu}(t-s, x-y)-G_{\nu}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2} \\
& \quad=\frac{1}{\sqrt{4 \pi v(t-s)}} G_{\nu / 2}(t-s, x-y)+\frac{1}{\sqrt{4 \pi v\left(t^{\prime}-s\right)}} G_{\nu / 2}\left(t^{\prime}-s, x^{\prime}-y\right)
\end{aligned}
$$

$$
-2 G_{2 v}\left(\frac{t+t^{\prime}}{2}-s, x-x^{\prime}\right) G_{\nu / 2}\left(\frac{2(t-s)\left(t^{\prime}-s\right)}{t+t^{\prime}-2 s}, y-\frac{(t-s) x^{\prime}+\left(t^{\prime}-s\right) x}{t+t^{\prime}-2 s}\right) .
$$

Then integrate over $y$ using the semigroup property of the heat kernel:

$$
\begin{align*}
\int_{\mathbb{R}} \mathrm{d} y & G_{\nu / 2}(s, y-\bar{z})\left(G_{\nu}(t-s, x-y)-G_{\nu}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2} \\
= & \frac{1}{\sqrt{4 \pi v(t-s)}} G_{\nu / 2}(t, x-\bar{z})+\frac{1}{\sqrt{4 \pi v\left(t^{\prime}-s\right)}} G_{\nu / 2}\left(t^{\prime}, x^{\prime}-\bar{z}\right) \\
& -2 G_{2 v}\left(\frac{t+t^{\prime}}{2}-s, x-x^{\prime}\right) \\
& \times G_{\nu / 2}\left(\frac{2(t-s)\left(t^{\prime}-s\right)}{t+t^{\prime}-2 s}+s, \frac{(t-s) x^{\prime}+\left(t^{\prime}-s\right) x}{t+t^{\prime}-2 s}-\bar{z}\right) \tag{4.18}
\end{align*}
$$

Property (4.3) Set $x=x^{\prime}$ in (4.17) and let $h=t^{\prime}-t$. Then $\frac{2(t-s)\left(t^{\prime}-s\right)}{t+t^{\prime}-2 s}+s=$ $t+\frac{(t-s) h}{2(t-s)+h}$ and (4.18) becomes

$$
\begin{aligned}
\int \mathrm{d} y G(G-G)^{2}= & {\left[\frac{1}{(4 \pi \nu(t-s))^{\frac{1}{2}}}+\frac{1}{\left(4 \pi \nu\left(t^{\prime}-s\right)\right)^{\frac{1}{2}}}-\frac{1}{\left(\pi \nu\left(\frac{t+t^{\prime}}{2}-s\right)\right)^{\frac{1}{2}}}\right] } \\
& \times G_{\nu / 2}(t, x-\bar{z}) \\
& +\frac{1}{\sqrt{4 \pi v\left(t^{\prime}-s\right)}}\left(\frac{G_{\nu / 2}\left(t^{\prime}, x-\bar{z}\right)}{G_{\nu / 2}(t, x-\bar{z})}-1\right) \\
& \times G_{\nu / 2}(t, x-\bar{z}) \\
& -\frac{1}{\sqrt{\pi v\left(\frac{t+t^{\prime}}{2}-s\right)}}\left(\frac{G_{\nu / 2}\left(t+\frac{(t-s) h}{2(t-s)+h}, x-\bar{z}\right)}{G_{\nu / 2}(t, x-\bar{z})}-1\right) \\
& \times G_{\nu / 2}(t, x-\bar{z}) \\
:= & I_{1}+I_{2}-I_{3}
\end{aligned}
$$

We first consider $I_{2}$. Because $1 / n \leq t \leq t^{\prime} \leq n$, we have that $h \in\left[0, n^{2} t\right]$, so by Lemma 5.7, we find after simplification that

$$
\left|I_{2}\right| \leq \frac{3 \sqrt{1+n^{2}}}{4 \sqrt{\pi v t\left(t^{\prime}-s\right)}} G_{\frac{v\left(1+n^{2}\right)}{2}}(t, x-\bar{z}) \sqrt{h},
$$

and so

$$
\begin{aligned}
\int_{0}^{t} \mathrm{~d} s G_{2 v}\left(s, z_{1}-z_{2}\right)\left|I_{2}\right| \leq & \sqrt{h} \int_{0}^{t} \mathrm{~d} s \frac{3 \sqrt{1+n^{2}}}{4 \sqrt{\pi v t\left(t^{\prime}-s\right)}} \\
& \times G_{v\left(1+n^{2}\right) / 2}(t, x-\bar{z}) G_{2 v}\left(s, z_{1}-z_{2}\right)
\end{aligned}
$$

Apply Lemma 5.4 to $G_{v\left(1+n^{2}\right) / 2}(\cdots) G_{2 v}(\cdots)$ and integrate over $\mathrm{d} z_{1} \mathrm{~d} z_{2}$ to get

$$
\begin{aligned}
& \iint_{\mathbb{R}^{2}}|\mu|\left(\mathrm{d} z_{1}\right)|\mu|\left(\mathrm{d} z_{2}\right) \int_{0}^{t} \mathrm{~d} s G_{2 v}\left|I_{2}\right| \\
& \quad \leq \frac{3\left(1+n^{2}\right) \sqrt{h}}{2 \sqrt{\pi v}}\left(|\mu| * G_{2 v\left(1+n^{2}\right)}(t, \cdot)\right)^{2}(x) \int_{0}^{t} \frac{\mathrm{~d} s}{\sqrt{s\left(t^{\prime}-s\right)}} .
\end{aligned}
$$

By the Beta integral (see (3.3)), the $\mathrm{d} s$-integral is less than or equal to $\pi$. So

$$
\begin{align*}
& \iint_{\mathbb{R}^{2}}|\mu|\left(\mathrm{d} z_{1}\right)|\mu|\left(\mathrm{d} z_{2}\right) \int_{0}^{t} \mathrm{~d} s G_{2 v}(\cdots)\left|I_{2}\right| \\
& \quad \leq \frac{3\left(1+n^{2}\right) \sqrt{\pi}}{2 \sqrt{v}}\left(|\mu| * G_{2 v\left(1+n^{2}\right)}(t, \cdot)\right)^{2}(x) \sqrt{h} . \tag{4.19}
\end{align*}
$$

As for $I_{3}$, notice that since $s \in[0, t], \frac{(t-s) h}{2(t-s)+h} \leq \frac{t h}{h} \leq n^{2} t$ for all $h \geq 0$. Apply Lemma 5.7 with $r=\frac{(t-s) h}{2(t-s)+h}$ to obtain that

$$
\left|\frac{G_{\nu / 2}\left(t+\frac{(t-s) h}{2(t-s)+h}, x-\bar{z}\right)}{G_{\nu / 2}(t, x-\bar{z})}-1\right| \leq \frac{3}{2 \sqrt{2}} \exp \left(\frac{n^{2}(x-\bar{z})^{2}}{v t\left(1+n^{2}\right)}\right) \frac{\sqrt{h}}{\sqrt{t}}, \quad \text { for all } h \geq 0
$$

where we have used the inequality $\frac{(t-s) h}{2(t-s)+h} \leq \frac{h}{2}$. Multiplying out the exponentials, we obtain

$$
\left|I_{3}\right| \leq \frac{3 \sqrt{1+n^{2}}}{2 \sqrt{2 \pi v t(t-s)}} G_{\nu\left(1+n^{2}\right) / 2}(t, x-\bar{z}) \sqrt{h}
$$

Then by the same arguments as for $I_{2}$, we have that

$$
\iint_{\mathbb{R}^{2}}|\mu|\left(\mathrm{d} z_{1}\right)|\mu|\left(\mathrm{d} z_{2}\right) \int_{0}^{t} \mathrm{~d} s G_{2 v}\left|I_{3}\right|=\frac{3\left(1+n^{2}\right) \sqrt{\pi}}{\sqrt{2 v}}\left(|\mu| * G_{2 v\left(1+n^{2}\right)}(t, \cdot)\right)^{2}(x) \sqrt{h} .
$$

Now let us consider $I_{1}$. Apply Lemma 5.4 to $G_{2 v}\left(s, z_{1}-z_{2}\right) G_{\nu / 2}(t, x-\bar{z})$ to get

$$
\begin{aligned}
& \int_{0}^{t} \mathrm{~d} s G_{2 v}\left(s, z_{1}-z_{2}\right)\left|I_{1}\right| \leq \frac{\sqrt{t}}{\sqrt{\pi v}} G_{2 v}\left(t, x-z_{1}\right) G_{2 v}\left(t, x-z_{2}\right) \\
& \quad \times \int_{0}^{t} \mathrm{~d} s\left|(s(t-s))^{-\frac{1}{2}}+\left(s\left(t^{\prime}-s\right)\right)^{-\frac{1}{2}}-2\left(s\left[\frac{t+t^{\prime}}{2}-s\right]\right)^{-\frac{1}{2}}\right| .
\end{aligned}
$$

The integrand is bounded by

$$
\left|(s(t-s))^{-\frac{1}{2}}-\left(s\left[\frac{t+t^{\prime}}{2}-s\right]\right)^{-\frac{1}{2}}\right|+\left|\left(s\left(t^{\prime}-s\right)\right)^{-\frac{1}{2}}-\left(s\left[\frac{t+t^{\prime}}{2}-s\right]\right)^{-\frac{1}{2}}\right|
$$

Taking into account the signs of the increment, this is equal to $[s(t-s)]^{-1 / 2}-$ $\left[s\left(t^{\prime}-s\right)\right]^{-1 / 2}$. Integrate the r.h.s. of the above inequality using the formula $\int_{0}^{t} \frac{\mathrm{~d} s}{\sqrt{s\left(t^{\prime}-s\right)}}=2 \arctan \left(\frac{\sqrt{t}}{\sqrt{t^{\prime}-t}}\right)$ for all $t^{\prime}>t \geq 0$ to find that
$\int_{0}^{t} \mathrm{~d} s\left|(s(t-s))^{-\frac{1}{2}}+\left(s\left(t^{\prime}-s\right)\right)^{-\frac{1}{2}}-2\left(s\left[\frac{t+t^{\prime}}{2}-s\right]\right)^{-\frac{1}{2}}\right| \leq \pi-2 \arctan (\sqrt{t / h})$.
It is an elementary calculus exercise to show that the function $f(x):=x(\pi-2 \arctan$ $(x)$ ) for $x \geq 0$ is non-negative and bounded from above, and $f(x) \leq \lim _{x \rightarrow+\infty} f(x)$ $=2$. Hence, $\pi-2 \arctan (\sqrt{t / h}) \leq 2 \sqrt{h / t}$. Therefore,

$$
\begin{equation*}
\iint_{\mathbb{R}^{2}}|\mu|\left(\mathrm{d} z_{1}\right)|\mu|\left(\mathrm{d} z_{2}\right) \int_{0}^{t} \mathrm{~d} s G_{2 v}\left(s, z_{1}-z_{2}\right)\left|I_{1}\right| \leq \frac{2 \sqrt{h}}{\sqrt{\pi v}}\left(|\mu| * G_{2 v}(t, \cdot)\right)^{2}(x) . \tag{4.20}
\end{equation*}
$$

We conclude from (4.19)-(4.20) that for all $(t, x),\left(t^{\prime}, x\right) \in[1 / n, n] \times[-n, n]$ with $t^{\prime}>t$,
$I\left(t, x ; t^{\prime}, x\right) \leq\left(C_{\nu}^{\star}\left(|\mu| * G_{2 v}(t, \cdot)\right)^{2}(x)+C_{n, v}^{*}\left(|\mu| * G_{2 v\left(1+n^{2}\right)}(t, \cdot)\right)^{2}(x)\right) \sqrt{h}$,
where

$$
C_{v}^{\star}=\frac{2}{\sqrt{\pi v}}, \quad \text { and } \quad C_{n, v}^{*}:=\frac{3 \sqrt{\pi}(1+\sqrt{2})\left(1+n^{2}\right)}{2 \sqrt{v}} .
$$

As for the contribution of the constant $\bar{\zeta}$, it corresponds to the initial data $\mu(\mathrm{d} x) \equiv \bar{\zeta} \mathrm{d} x$ and we apply Proposition 5.2. Finally, by the smoothing effect of the heat kernel (Lemma 2.3), we can choose the following constant

$$
\begin{aligned}
C_{n, 1}= & \bar{\varsigma}^{2} \frac{\sqrt{2}-1}{\sqrt{\pi v}}+\sup 2\left(C_{v}^{\star}\left(|\mu| * G_{2 v}(s, \cdot)\right)^{2}(y)\right. \\
& \left.+C_{n, v}^{*}\left(|\mu| * G_{2 v\left(1+n^{2}\right)}(s, \cdot)\right)^{2}(y)\right),
\end{aligned}
$$

for (4.3), where the supremum is over $(s, y) \in[1 / n, n] \times[-n, n]$. This proves (4.3).
Property (4.4) Set $t=t^{\prime}$ in (4.17) and $\bar{x}=\frac{x+x^{\prime}}{2}$. Consider the integral in (4.17)

$$
\int_{0}^{t} \mathrm{~d} s G_{2 v}\left(s, z_{1}-z_{2}\right) \int \mathrm{d} y G(G-G)^{2}
$$

which is denoted by $\int \mathrm{d} s G \int \mathrm{~d} y G(G-G)^{2}$ for convenience. By (4.18),

$$
\begin{gather*}
\int \mathrm{d} y G_{\nu / 2}(s, y-\bar{z})\left(G_{\nu}(t-s, x-y)-G_{\nu}\left(t-s, x^{\prime}-y\right)\right)^{2} \\
=\frac{1}{\sqrt{4 \pi \nu(t-s)}}\left[G_{\nu / 2}(t, x-\bar{z})+G_{\nu / 2}\left(t, x^{\prime}-\bar{z}\right)\right]  \tag{4.21}\\
-2 G_{2 v}\left(t-s, x-x^{\prime}\right) G_{\nu / 2}(t, \bar{x}-\bar{z}) .
\end{gather*}
$$

Then apply Lemma 5.5 to integrate over $s$ :

$$
\begin{aligned}
\int \mathrm{d} s G & \int \mathrm{~d} y G(G-G)^{2}=\frac{1}{4 v}\left(G_{\nu / 2}(t, x-\bar{z})+G_{\nu / 2}\left(t, x^{\prime}-\bar{z}\right)\right) \operatorname{erfc}\left(\frac{\left|z_{1}-z_{2}\right|}{\sqrt{4 v t}}\right) \\
& -\frac{1}{2 v} G_{\nu / 2}(t, \bar{x}-\bar{z}) \operatorname{erfc}\left(\frac{1}{\sqrt{2 t}}\left[\frac{\left|z_{1}-z_{2}\right|}{\sqrt{2 v}}+\frac{\left|x-x^{\prime}\right|}{\sqrt{2 v}}\right]\right) .
\end{aligned}
$$

It follows from the definition of $\operatorname{erfc}(x)$ that $\operatorname{erfc}(|x|+h) \geq \operatorname{erfc}(|x|)-\frac{2 e^{-x^{2}}}{\sqrt{\pi}} h$ for $h \geq 0$ and we apply this inequality to the last factor to obtain

$$
\begin{aligned}
& \int \mathrm{d} s G \int \mathrm{~d} y G(G-G)^{2} \\
& \quad \leq \frac{1}{v} G_{\nu / 2}(t, \bar{x}-\bar{z}) \frac{\left|x-x^{\prime}\right|}{\sqrt{4 \pi \nu t}} \exp \left(-\frac{\left(z_{1}-z_{2}\right)^{2}}{4 \nu t}\right) \\
& \quad+\frac{1}{4 v}\left[G_{\nu / 2}(t, x-\bar{z})+G_{\nu / 2}\left(t, x^{\prime}-\bar{z}\right)-2 G_{\nu / 2}(t, \bar{x}-\bar{z})\right] \operatorname{erfc}\left(\frac{\left|z_{1}-z_{2}\right|}{\sqrt{4 \nu t}}\right) .
\end{aligned}
$$

Now apply Lemma 4.7 with $h=\frac{x^{\prime}-x}{2}, L=2 n$ and $\beta=1 / 2$ : there are two constants

$$
\begin{aligned}
& C_{n}^{\prime}=\sup _{s \in[1 / n, n]} C_{2 n, 1 / 2, v s}=\frac{C \sqrt{n}}{\sqrt{2 v}}+\frac{1}{n}, \quad C \approx 0.451256, \\
& C_{n}^{\prime \prime}=\sup _{s \in[1 / n, n]} C_{2 n, 1 / 2, v s}^{\prime \prime}=C_{n}^{\prime} \exp \left(\frac{6 n^{3}}{v}\right),
\end{aligned}
$$

where $C_{L, \beta, \nu s}^{\prime}$ and $C_{L, \beta, \nu s}^{\prime \prime}$ are defined in Lemma 4.7, such that for $\left|\frac{x-x^{\prime}}{2}\right| \leq \beta L=n$,

$$
\begin{aligned}
& \left|G_{\nu / 2}(t, x-\bar{z})+G_{\nu / 2}\left(t, x^{\prime}-\bar{z}\right)-2 G_{\nu / 2}(t, \bar{x}-\bar{z})\right| \\
& \leq\left\{C_{n}^{\prime \prime}\left[G_{\nu / 2}(t, \bar{x}-\bar{z}-2 L)+G_{\nu / 2}(t, \bar{x}-\bar{z}+2 L)\right]\right. \\
& \left.\quad+C_{n}^{\prime} G_{\nu / 2}(t, \bar{x}-\bar{z})\right\}\left|x-x^{\prime}\right| .
\end{aligned}
$$

Note that $t \geq 1 / n$ is essential for this inequality to be valid. By Lemma 5.5, we have that erfc $\left(\frac{\left|z_{1}-z_{2}\right|}{\sqrt{4 \nu t}}\right) \leq \sqrt{4 \pi \nu t} G_{2 v}\left(t, z_{1}-z_{2}\right)$, and so

$$
\begin{aligned}
&\left|\int \mathrm{d} s G \int \mathrm{~d} y G(G-G)^{2}\right| \\
& \quad\left(\frac{1}{v}+\frac{\sqrt{\pi t}}{\sqrt{4 v}} C_{n}^{\prime}\right)\left|x-x^{\prime}\right| G_{\nu / 2}(t, \bar{x}-\bar{z}) G_{2 v}\left(t, z_{1}-z_{2}\right) \\
&+\frac{\sqrt{\pi t} C_{n}^{\prime \prime}}{\sqrt{4 v}}\left|x-x^{\prime}\right| G_{\nu / 2}(t, \bar{x}-\bar{z}-2 L) G_{2 v}\left(t, z_{1}-z_{2}\right) \\
&+\frac{\sqrt{\pi t} C_{n}^{\prime \prime}}{\sqrt{4 v}}\left|x-x^{\prime}\right| G_{\nu / 2}(t, \bar{x}-\bar{z}+2 L) G_{2 v}\left(t, z_{1}-z_{2}\right)
\end{aligned}
$$

Now apply Lemma 5.4:

$$
\begin{aligned}
& \left|\int \mathrm{d} s G \int \mathrm{~d} y G(G-G)^{2}\right| \\
& \leq\left(\frac{1}{v}+\frac{\sqrt{\pi n}}{\sqrt{4 v}} C_{n}^{\prime}\right)\left|x-x^{\prime}\right| G_{2 v}\left(t, \widetilde{x}_{1}-z_{1}\right) G_{2 v}\left(t, \widetilde{x}_{1}-z_{2}\right) \\
& \quad+\frac{\sqrt{\pi n} C_{n}^{\prime \prime}}{\sqrt{4 v}}\left|x-x^{\prime}\right| G_{2 v}\left(t, \widetilde{x}_{2}-z_{1}\right) G_{2 v}\left(t, \widetilde{x}_{2}-z_{2}\right) \\
& \quad+\frac{\sqrt{\pi n} C_{n}^{\prime \prime}}{\sqrt{4 v}}\left|x-x^{\prime}\right| G_{2 v}\left(t, \widetilde{x}_{3}-z_{1}\right) G_{2 v}\left(t, \widetilde{x}_{3}-z_{2}\right),
\end{aligned}
$$

where $\widetilde{x}_{1}=\bar{x}, \widetilde{x}_{2}=\bar{x}-2 L$ and $\widetilde{x}_{3}=\bar{x}+2 L$. Clearly, $\widetilde{x}_{i} \in[-5 n, 5 n]$ for all $i=1,2,3$. Finally, after integrating over $|\mu|\left(\mathrm{d} z_{1}\right)$ and $|\mu|\left(\mathrm{d} z_{2}\right)$, we see that

$$
I\left(t, x ; t, x^{\prime}\right) \leq C_{n, 3}^{\prime}\left|x-x^{\prime}\right|
$$

for all $t \in[1 / n, n]$, and $x, x^{\prime} \in[-n, n]$, where the constant is equal to

$$
C_{n, 3}^{\prime}=\left(\frac{1}{v}+\frac{\sqrt{\pi n}}{\sqrt{4 v}}\left(C_{n}^{\prime}+2 C_{n}^{\prime \prime}\right)\right) \sup _{(s, y) \in[1 / n, n] \times[-5 n, 5 n]}\left(|\mu| * G_{2 v}(s, \cdot)\right)^{2}(y) .
$$

As for the contribution of the constant $\bar{\zeta}$, it corresponds to the initial data $|\mu|(\mathrm{d} x) \equiv$ $\bar{\varsigma} \mathrm{d} x$ and we apply Proposition 5.2. Finally, one can choose, for (4.4),

$$
C_{n, 3}=\frac{\bar{\varsigma}^{2}}{v}+\left(\frac{2}{v}+\frac{\sqrt{\pi n}}{\sqrt{v}}\left(C_{n}^{\prime}+2 C_{n}^{\prime \prime}\right)\right) \sup _{(s, y) \in[1 / n, n] \times[-5 n, 5 n]}\left(|\mu| * G_{2 v}(s, \cdot)\right)^{2}(y) .
$$

This constant $C_{n, 3}$ is clearly finite. This completes the proof of (4.4).
Property (4.5) We first consider the contribution of $J_{0}^{*}(t, x)$. As before, let

$$
I\left(t, x ; t^{\prime}, x^{\prime}\right)=\iint_{\left[t, t^{\prime}\right] \times \mathbb{R}} \mathrm{d} s \mathrm{~d} y\left[J_{0}^{*}(s, y)\right]^{2} G_{v}^{2}\left(t^{\prime}-s, x^{\prime}-y\right) .
$$

Set $\bar{z}=\left(z_{1}+z_{2}\right) / 2$. Similar to the arguments leading to (4.17), we have

$$
\begin{align*}
I\left(t, x ; t^{\prime}, x^{\prime}\right)= & \int_{t}^{t^{\prime}} \mathrm{d} s \iint_{\mathbb{R}^{2}}|\mu|\left(\mathrm{d} z_{1}\right)|\mu|\left(\mathrm{d} z_{2}\right) G_{2 v}\left(s, z_{1}-z_{2}\right) \\
& \times \int_{\mathbb{R}} \mathrm{d} y G_{\nu / 2}(s, y-\bar{z}) G_{v}^{2}\left(t^{\prime}-s, x^{\prime}-y\right) . \tag{4.22}
\end{align*}
$$

Apply Lemma 5.3 to $G_{v}^{2}\left(t^{\prime}-s, x^{\prime}-y\right)$ and then integrate over $y$,

$$
\begin{aligned}
I\left(t, x ; t^{\prime}, x^{\prime}\right)= & \int_{t}^{t^{\prime}} \mathrm{d} s \iint_{\mathbb{R}^{2}}|\mu|\left(\mathrm{d} z_{1}\right)|\mu|\left(\mathrm{d} z_{2}\right) \frac{1}{\sqrt{4 \pi v\left(t^{\prime}-s\right)}} \\
& \times G_{2 v}\left(s, z_{1}-z_{2}\right) G_{\nu / 2}\left(t^{\prime}, x^{\prime}-\bar{z}\right) .
\end{aligned}
$$

Now apply Lemma 5.4 to $G_{2 v}\left(s, z_{1}-z_{2}\right) G_{\nu / 2}\left(t^{\prime}, x^{\prime}-\bar{z}\right)$. Then by Lemma 5.8 and the fact that $\arcsin (x) \leq \pi x / 2$ for $x \in[0,1]$, we see that

$$
I\left(t, x ; t^{\prime}, x^{\prime}\right) \leq\left|J_{0}^{*}\left(2 t^{\prime}, x^{\prime}\right)\right|^{2} \frac{2 \sqrt{t^{\prime}}}{\sqrt{\pi v}} \arcsin \left(\sqrt{\frac{t^{\prime}-t}{t^{\prime}}}\right) \leq\left|J_{0}^{*}\left(2 t^{\prime}, x^{\prime}\right)\right|^{2} \sqrt{\frac{\pi}{v}} \sqrt{t^{\prime}-t}
$$

Therefore,

$$
I\left(t, x ; t^{\prime}, x^{\prime}\right) \leq C_{n, 5}^{\prime} \sqrt{t^{\prime}-t}, \quad \text { with } C_{n, 5}^{\prime}=\sqrt{\frac{\pi}{v}} \sup _{(s, y) \in[1 / n, n] \times[-n, n]}\left|J_{0}^{*}(2 s, y)\right|^{2}
$$

As for the contribution of $\bar{\zeta}$, it corresponds to the initial data $|\mu|(\mathrm{d} x) \equiv \bar{\zeta} \mathrm{d} x$ and we apply Proposition 5.2. Finally, we can choose

$$
\begin{equation*}
C_{n, 5}=\frac{\bar{\varsigma}^{2}}{\sqrt{\pi v}}+2 \sqrt{\frac{\pi}{v}} \sup _{(s, y) \in[1 / n, n] \times[-n, n]}\left|J_{0}^{*}(2 s, y)\right|^{2} \tag{4.23}
\end{equation*}
$$

for (4.5). This completes the proof of (4.5) and therefore part (1) of Proposition 4.4.

Proof of Proposition 4.5 (1) We first prove (4.7) and (4.8). Denote

$$
\begin{aligned}
I\left(t, x ; t^{\prime}, x^{\prime}\right)= & \iint_{[0, t] \times \mathbb{R}} \mathrm{d} s \mathrm{~d} y\left(\left|J_{0}^{*}\right|^{2} \star G_{v}^{2}\right)(s, y)\left(G_{v}(t-s, x-y)\right. \\
& \left.-G_{v}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2}
\end{aligned}
$$

Let $\bar{z}=\left(z_{1}+z_{2}\right) / 2$. As in (4.17), replace $\left|J_{0}^{*}(u, z)\right|^{2}$ by the double integral. By Lemma 5.3,

$$
\begin{aligned}
I\left(t, x ; t^{\prime}, x^{\prime}\right)= & \iint_{\mathbb{R}^{2}}|\mu|\left(\mathrm{d} z_{1}\right)|\mu|\left(\mathrm{d} z_{2}\right) \int_{0}^{t} \mathrm{~d} s \int_{0}^{s} \mathrm{~d} u \frac{1}{\sqrt{4 v \pi(s-u)}} G_{2 v}\left(u, z_{1}-z_{2}\right) \\
& \times \iint_{\mathbb{R}^{2}} \mathrm{~d} y \mathrm{~d} z G_{v / 2}(u, z-\bar{z}) G_{\nu / 2}(s-u, y-z) \\
& \times\left(G_{v}(t-s, x-y)-G_{v}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2} .
\end{aligned}
$$

We first integrate over $\mathrm{d} z$ using the semigroup property and then integrate over $\mathrm{d} u$ by using Lemma 5.5 and use the fact that $s \leq t \leq n$ to obtain

$$
\begin{align*}
& I\left(t, x ; t^{\prime}, x^{\prime}\right) \leq \frac{\sqrt{\pi n}}{\sqrt{4 v}} \int_{0}^{t} \mathrm{~d} s \iint_{\mathbb{R}^{2}}|\mu|\left(\mathrm{d} z_{1}\right)|\mu|\left(\mathrm{d} z_{2}\right) G_{2 v}\left(s, z_{1}-z_{2}\right) \\
& \quad \times \int_{\mathbb{R}} \mathrm{d} y G_{\nu / 2}(s, y-\bar{z})\left(G_{\nu}(t-s, x-y)-G_{v}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2} . \tag{4.24}
\end{align*}
$$

Comparing this upper bound with (4.17), we can apply Proposition 4.4 to conclude that (4.7) and (4.8) are true with the constants $C_{n, 2}$ and $C_{n, 4}$ given in (4.6). As for (4.9), let

$$
I\left(t, x ; t^{\prime}, x^{\prime}\right)=\iint_{\left[t, t^{\prime}\right] \times \mathbb{R}} \mathrm{d} s \mathrm{~d} y\left(\left|J_{0}^{*}\right|^{2} \star G_{v}^{2}\right)(s, y) G_{\nu}^{2}\left(t^{\prime}-s, x^{\prime}-y\right)
$$

By arguments similar to those leading to (4.24), we have that

$$
\begin{aligned}
I\left(t, x ; t^{\prime}, x^{\prime}\right) \leq \frac{\sqrt{\pi n}}{4 v} & \int_{t}^{t^{\prime}} \mathrm{d} s \iint_{\mathbb{R}^{2}}|\mu|\left(\mathrm{d} z_{1}\right)|\mu|\left(\mathrm{d} z_{2}\right) G_{2 v}\left(s, z_{1}-z_{2}\right) \\
& \times \int_{\mathbb{R}} \mathrm{d} y G_{\nu / 2}(s, y-\bar{z}) G_{\nu}^{2}\left(t^{\prime}-s, x^{\prime}-y\right)
\end{aligned}
$$

Comparing this upper bound with (4.22), we can apply Proposition 4.4 to conclude that (4.9) is true with the corresponding constant $C_{n, 6}$ given in (4.6). This completes the proof of part (1) of Proposition 4.5.

### 4.4 Proofs of part (2) of the Propositions 4.4 and 4.5

Lemma 4.8 For $a \geq 1$ and $b \geq(a e)^{-1}$, we have that $|x| \leq e^{b|x|^{a}}$ for all $x \in \mathbb{R}$.
Proof The case where $x=0$ is clearly true. We only need to consider the case where $x>0$. Equivalently, we need to solve the critical case where the graphs of the two functions $\log x$ and $b x^{a}$ intersect exactly once $(x>0)$, that is,

$$
\log x=b x^{a}, \quad \text { and } \quad \frac{1}{x}=a b x^{a-1}
$$

which implies $x=e^{1 / a}$ and $b=(a e)^{-1}$. When $b$ is bigger than this critical value, the function $b|x|^{a}$ will dominate $\log x$ for all $x>0$.

Lemma 4.9 Let $g(x)=e^{c|x|^{a}}$ with $c>0$ and $a>1$. For all $n>0$, the following properties hold:
(1) For all $x, z \in \mathbb{R}, 0 \leq t \leq t^{\prime} \leq n$,

$$
\left|g(x-\sqrt{t} z)-g\left(x-\sqrt{t^{\prime}} z\right)\right| \leq a c \exp \left(c_{1}|x|^{a}+c_{2}|z|^{a}\right)\left|t^{\prime}-t\right|^{1 / 2},
$$

where the two constants $c_{1}:=c_{1}(a, c)$ and $c_{2}:=c_{2}(n, a, c)$ can be chosen as follows:

$$
c_{1}(a, c)=\left(c+\frac{a-1}{a e}\right) 2^{a-1}, \quad \text { and } \quad c_{2}(n, a, c)=c_{1}(a, c) n^{a / 2}+\frac{1}{a e} .
$$

(2) For all $x, x^{\prime} \in[-n, n], z \in \mathbb{R}$ and $t \in[0, n]$,

$$
\left|g(x-\sqrt{t} z)-g\left(x^{\prime}-\sqrt{t} z\right)\right| \leq c_{3} \exp \left(c_{4}|z|^{a}\right)\left|x^{\prime}-x\right|
$$

where the two constants $c_{3}:=c_{3}(n, a, c)$ and $c_{4}:=c_{4}(n, a, c)$ can be chosen as follows:

$$
c_{3}(n, a, c):=a c e^{c_{1} n^{a}}, \quad \text { and } \quad c_{4}(n, a, c)=c_{1} n^{a / 2}
$$

Proof (1) Because $a>1$, the function $g$ belongs to $C^{1}(\mathbb{R})$, is convex and $g^{\prime}(x) \geq 0$ for $x \geq 0$. Hence,

$$
\left|g(x-\sqrt{t} z)-g\left(x-\sqrt{t^{\prime}} z\right)\right| \leq\left|g^{\prime}(|x|+\sqrt{n}|z|)\right| \cdot\left|\sqrt{t^{\prime}} z-\sqrt{t} z\right| .
$$

Let $b=(a e)^{-1}$. By Lemma 4.8, $\left|g^{\prime}(x)\right|=a c|x|^{a-1} e^{c|x|^{a}} \leq a c e^{(c+(a-1) b)|x|^{a}}$. Thus

$$
\begin{equation*}
\left|g^{\prime}(|x|+\sqrt{n}|z|)\right| \leq a c e^{(c+(a-1) b)(|x|+\sqrt{n}|z|)^{a}} \leq a c e^{c_{1}|x|^{a}+c_{1} n^{a / 2}|z|^{a}} \tag{4.25}
\end{equation*}
$$

where we have applied the inequality $(x+y)^{a} \leq 2^{a-1}\left(x^{a}+y^{a}\right)$ for all $x, y \geq 0$. Clearly,

$$
\begin{equation*}
\left|\sqrt{t^{\prime}}-\sqrt{t}\right| \leq \sqrt{t^{\prime}-t} \tag{4.26}
\end{equation*}
$$

Finally, apply Lemma 4.8 to $|z|$, and combining all the above bounds proves (1).
(2) Similarly to (1),

$$
\left|g(x-\sqrt{t} z)-g\left(x^{\prime}-\sqrt{t} z\right)\right| \leq\left|g^{\prime}(|n|+\sqrt{n}|z|)\right| \cdot\left|x-x^{\prime}\right|,
$$

and by (4.25), $\left|g^{\prime}(|n|+\sqrt{n}|z|)\right| \leq a c e^{c_{1} n^{a}+c_{1} n^{a / 2}|z|^{a}}$. This proves (2).
For $c>0$ and $a \in[0,2[$, define the constant

$$
K_{a, c}(\nu t):=\left(e^{\left.c|\cdot|\right|^{a}} * G_{v}(t, \cdot)\right)(0) .
$$

For $0 \leq t \leq n$, we have that

$$
\begin{equation*}
K_{a, c}(\nu t)=\int_{\mathbb{R}} \mathrm{d} y e^{c(\sqrt{t}|y|)^{a}} G_{\nu}(1, y) \leq \int_{\mathbb{R}} \mathrm{d} y e^{c(\sqrt{n}|y|)^{a}} G_{\nu}(1, y)=K_{a, c}(\nu n) . \tag{4.27}
\end{equation*}
$$

Proof of Proposition 4.4 (2) Because $\mu \in \mathcal{M}_{H}^{*}(\mathbb{R})$, there are a function $f(x)$ and two constants $a \in[1,2[$ and $c>0$ such that $\mu(\mathrm{d} x)=f(x) \mathrm{d} x$ and $c=$ $\sup _{x \in \mathbb{R}}|f(x)| e^{-|x|^{a}}<+\infty$. In the following, we assume that $x, x^{\prime} \in[-n, n]$, and $t, t^{\prime} \in[0, n]$. Set $g(x)=e^{2^{a}|x|^{a}}$ and assume that $\bar{\zeta}=0$. From (4.17),

$$
\begin{aligned}
I\left(t, x ; t^{\prime}, x^{\prime}\right) \leq & c^{2} \int_{0}^{t} \mathrm{~d} s \iint_{\mathbb{R}^{2}} \mathrm{~d} z_{1} \mathrm{~d} z_{2} e^{\left|z_{1}\right|^{a}+\left|z_{2}\right|^{a}} G_{2 v}\left(s, z_{1}-z_{2}\right) \\
& \times \int_{\mathbb{R}} \mathrm{d} y G_{\nu / 2}(s, y-\bar{z})\left(G_{v}(t-s, x-y)-G_{v}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2} .
\end{aligned}
$$

We shall apply the change of variables $z=\bar{z}$ and $w=\Delta z$ : since
$\left|z_{1}\right|^{a}+\left|z_{2}\right|^{a}=\left|z+\frac{w}{2}\right|^{a}+\left|z-\frac{w}{2}\right|^{a} \leq 2^{a-1}\left(|z|^{a}+\left|\frac{w}{2}\right|^{a}\right) \times 2=2^{a}|z|^{a}+|w|^{a}$,
we see that

$$
e^{\left|z_{1}\right|^{a}+\left|z_{2}\right|^{a}} \leq e^{2^{a}|z|^{a}+|w|^{a}}=e^{|w|^{a}} g(z)
$$

and it follows that

$$
\begin{align*}
I\left(t, x ; t^{\prime}, x^{\prime}\right) \leq & c^{2} \int_{0}^{t} \mathrm{~d} s \int_{\mathbb{R}} \mathrm{d} z\left(e^{\mid \cdot \|^{a}} * G_{2 v}(s, \cdot)\right)(0) g(z) \\
& \times \int_{\mathbb{R}} \mathrm{d} y G_{\nu / 2}(s, y-z)\left(G_{\nu}(t-s, x-y)-G_{\nu}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2} \\
\leq & c^{2} K_{a, 1}(2 v n) \int_{0}^{t} \mathrm{~d} s \int_{\mathbb{R}} \mathrm{d} z g(z) \\
& \times \int_{\mathbb{R}} \mathrm{d} y G_{\nu / 2}(s, y-z)\left(G_{\nu}(t-s, x-y)-G_{\nu}\left(t^{\prime}-s, x^{\prime}-y\right)\right)^{2} \tag{4.28}
\end{align*}
$$

where the second inequality is due to (4.27).
Property (4.3) For the moment, we continue to assume that $\bar{\zeta}=0$. Set $x=x^{\prime}$. Apply (4.18) with $x=x^{\prime}$ and $\bar{z}$ replaced by $z$, integrate over $\mathrm{d} z$, and use (4.28) to see that,

$$
\begin{aligned}
I\left(t, x ; t^{\prime}, x\right) \leq & c^{2} K_{a, 1}(2 \nu n) \int_{0}^{t} \mathrm{~d} s\left(\frac{1}{\sqrt{4 \pi v(t-s)}}\left(g * G_{\nu / 2}(t, \cdot)\right)(x)\right. \\
& +\frac{1}{\sqrt{4 \pi v\left(t^{\prime}-s\right)}}\left(g * G_{\nu / 2}\left(t^{\prime}, \cdot\right)\right)(x) \\
& \left.-\frac{2}{\sqrt{4 \pi v\left(\frac{t+t^{\prime}}{2}-s\right)}}\left(g * G_{\nu / 2}\left(t+\frac{(t-s) h}{2(t-s)+h}, \cdot\right)\right)(x)\right)
\end{aligned}
$$

$$
\leq c^{2} K_{a, 1}(2 v n) \int_{0}^{t} \mathrm{~d} s\left(I_{1}+I_{2}+I_{3}\right)
$$

where, letting $h=t^{\prime}-t$,

$$
\begin{aligned}
I_{1}= & {\left[(4 \pi v(t-s))^{-\frac{1}{2}}+\left(4 \pi v\left(t^{\prime}-s\right)\right)^{-\frac{1}{2}}-\left(\pi v\left(\frac{t+t^{\prime}}{2}-s\right)\right)^{-\frac{1}{2}}\right] } \\
& \times\left(g * G_{\nu / 2}(t, \cdot)\right)(x) \\
I_{2}= & \frac{1}{\sqrt{4 \pi v\left(t^{\prime}-s\right)}}\left[\left(g * G_{\nu / 2}\left(t^{\prime}, \cdot\right)\right)(x)-\left(g * G_{\nu / 2}(t, \cdot)\right)(x)\right] \\
I_{3}= & \frac{2}{\sqrt{4 \pi v\left(\frac{t+t^{\prime}}{2}-s\right)}}\left[\left(g * G_{\nu / 2}\left(t+\frac{(t-s) h}{2(t-s)+h}, \cdot\right)\right)(x)\right. \\
& \left.-\left(g * G_{\nu / 2}(t, \cdot)\right)(x)\right] .
\end{aligned}
$$

Set $\bar{t}=\frac{t+t^{\prime}}{2}$. By (4.26),

$$
\begin{aligned}
\int_{0}^{t} I_{1} \mathrm{~d} s & =\frac{1}{\sqrt{\pi v}}\left(\sqrt{t}+\sqrt{t^{\prime}}-\sqrt{h}-2 \sqrt{\bar{t}}+2 \sqrt{\bar{t}-t}\right)\left(g * G_{\nu / 2}(t, \cdot)\right)(x) \\
& \leq \frac{1}{\sqrt{\pi v}}\left(|\sqrt{t}-\sqrt{\bar{t}}|+\left|\sqrt{t^{\prime}}-\sqrt{\bar{t}}\right|-\sqrt{h}+2 \sqrt{\frac{h}{2}}\right)\left(g * G_{\nu / 2}(t, \cdot)\right)(x) \\
& \leq \frac{1}{\sqrt{\pi v}}\left(4 \sqrt{\frac{h}{2}}-\sqrt{h}\right)\left(g * G_{\nu / 2}(t, \cdot)\right)(x)
\end{aligned}
$$

By Lemma 4.9, for some constants $c_{i}>0, i=1,2$,

$$
\begin{gathered}
\left|I_{2}\right| \leq \frac{1}{\sqrt{4 \pi v\left(t^{\prime}-s\right)}} \int_{\mathbb{R}} \mathrm{d} z\left|g(x-\sqrt{t} z)-g\left(x-\sqrt{t^{\prime}} z\right)\right| G_{\nu / 2}(1, z) \\
\leq \frac{1}{\sqrt{4 \pi v(t-s)}} a 2^{a} e^{c_{1}|x|^{a}}\left(e^{c_{2}|\cdot|^{a}} * G_{\nu / 2}(1, \cdot)\right)(0) \sqrt{h} .
\end{gathered}
$$

Hence, for all $0 \leq t \leq t^{\prime} \leq n$ and $x \in[-n, n]$,

$$
\int_{0}^{t} \mathrm{~d} s\left|I_{2}\right| \leq \frac{a 2^{a} \sqrt{n}}{\sqrt{\pi v}} e^{c_{1}|n|^{a}} K_{a, c_{2}}\left(\frac{v}{2}\right) \sqrt{h} .
$$

Similarly, because $\frac{(t-s) h}{2(t-s)+h} \leq \frac{h}{2}$, for all $0 \leq s \leq t \leq t^{\prime} \leq n$ and $x \in[-n, n]$,

$$
\int_{0}^{t} \mathrm{~d} s\left|I_{3}\right| \leq \frac{a 2^{a} \sqrt{n}}{\sqrt{2 \pi v}} e^{c_{1}|n|^{a}} K_{a, c_{2}}\left(\frac{v}{2}\right) \sqrt{h} .
$$

Therefore, for all $0 \leq t \leq t^{\prime} \leq n$ and $x \in[-n, n], I\left(t, x ; t^{\prime}, x\right) \leq \widetilde{C}_{n, 1}^{*} \sqrt{t^{\prime}-t}$ with

$$
\begin{aligned}
\widetilde{C}_{n, 1}^{*}= & \frac{c^{2} K_{a, 1}(2 v n)}{\sqrt{2 \pi v}}\left[(\sqrt{2}+1) a 2^{a} \sqrt{n} e^{c_{1}|n|^{a}} K_{a, c_{2}}\left(\frac{v}{2}\right)\right. \\
& \left.+(4-\sqrt{2}) \sup _{(s, y) \in[0, n] \times[-n, n]}\left(e^{2^{a}|\cdot|^{a}} * G_{\nu / 2}(s, \cdot)\right)(y)\right] .
\end{aligned}
$$

Finally, as for (4.3), the contribution of the constant $\bar{\zeta}$ can be calculated by using Proposition 5.2. Therefore, one can choose

$$
C_{n, 1}^{*}=\bar{\zeta}^{2} \frac{\sqrt{2}-1}{\sqrt{\pi v}}+2 \widetilde{C}_{n, 1}^{*} .
$$

Property (4.4) Assume again that $\bar{\zeta}=0$. Set $t=t^{\prime}$ and $\bar{x}=\frac{x+x^{\prime}}{2}$. Recalling (4.21), we see that the inequality (4.28) reduces to

$$
\begin{aligned}
I\left(t, x ; t, x^{\prime}\right) \leq & c^{2} K_{a, 1}(2 v n) \int_{0}^{t} \mathrm{~d} s \int_{\mathbb{R}} \mathrm{d} z g(z)\left\{\frac { 1 } { \sqrt { 4 \pi v ( t - s ) } } \left[G_{\nu / 2}(t, x-z)\right.\right. \\
& \left.\left.+G_{\nu / 2}\left(t, x^{\prime}-z\right)\right]-2 G_{2 v}\left(t-s, x-x^{\prime}\right) G_{\nu / 2}(t, \bar{x}-z)\right\}
\end{aligned}
$$

Then integrate over $\mathrm{d} s$ using Lemma 5.6:

$$
\begin{aligned}
& I\left(t, x ; t, x^{\prime}\right) \leq c^{2} K_{a, 1}(2 v n) \int_{\mathbb{R}} \mathrm{d} z g(z)\left\{\frac{\sqrt{t}}{\sqrt{\pi v}}\left[G_{v / 2}(t, x-z)+G_{v / 2}\left(t, x^{\prime}-z\right)\right]\right. \\
&\left.-2\left[2 t G_{2 v}\left(t, x-x^{\prime}\right)-\frac{1}{2 v}\left|x-x^{\prime}\right| \operatorname{erfc}\left(\frac{\left|x-x^{\prime}\right|}{\sqrt{4 v t}}\right)\right] G_{\nu / 2}(t, \bar{x}-z)\right\} .
\end{aligned}
$$

Denote $F(x)=\left(g * G_{\nu / 2}(t, \cdot)\right)(x)$. Then integrating over $\mathrm{d} z$ gives

$$
\begin{aligned}
I\left(t, x ; t, x^{\prime}\right) \leq & c^{2} K_{a, 1}(2 v n)\left\{\frac{\sqrt{t}}{\sqrt{\pi v}}\left[F(x)+F\left(x^{\prime}\right)\right]\right. \\
& \left.-2\left[\frac{\sqrt{t}}{\sqrt{\pi v}} e^{-\frac{\left(x-x^{\prime}\right)^{2}}{4 v t}}-\frac{1}{2 v}\left|x-x^{\prime}\right| \operatorname{erfc}\left(\frac{\left|x-x^{\prime}\right|}{\sqrt{4 v t}}\right)\right] F(\bar{x})\right\}
\end{aligned}
$$

$$
\begin{aligned}
\leq & c^{2} K_{a, 1}(2 v n)\left\{\frac{\sqrt{t}}{\sqrt{\pi v}}|F(x)-F(\bar{x})|+\frac{\sqrt{t}}{\sqrt{\pi v}}\left|F\left(x^{\prime}\right)-F(\bar{x})\right|\right. \\
& \left.+\frac{2 \sqrt{t}}{\sqrt{\pi v}}\left(1-e^{-\frac{\left|x-x^{\prime}\right|^{2}}{4 v t}}\right) F(\bar{x})+\frac{1}{v}\left|x-x^{\prime}\right| F(\bar{x})\right\} .
\end{aligned}
$$

Notice that $0 \leq 1-e^{-x^{2} / 2} \leq \widetilde{C}|x|$, where the universal constant $\widetilde{C}$ is given in Lemma 4.7. By part (2) of Lemma 4.9, for some constants $c_{i}, i=3,4$,

$$
\begin{aligned}
|F(x)-F(\bar{x})| & \leq \int_{\mathbb{R}} \mathrm{d} z|g(x-\sqrt{t} z)-g(\bar{x}-\sqrt{t} z)| G_{\nu / 2}(1, z) \\
& \leq c_{3}\left(e^{c_{4}|\cdot|^{a}} * G_{\nu / 2}(1, \cdot)\right)(0)|x-\bar{x}| \\
& =\frac{c_{3}}{2} K_{a, c_{4}}\left(\frac{\nu}{2}\right)\left|x-x^{\prime}\right| .
\end{aligned}
$$

Similarly, $\left|F\left(x^{\prime}\right)-F(\bar{x})\right| \leq \frac{c_{3}}{2} K_{a, c_{4}}\left(\frac{\nu}{2}\right)\left|x-x^{\prime}\right|$. Hence,

$$
I\left(t, x ; t, x^{\prime}\right) \leq c^{2} K_{a, 1}(2 v n)\left\{\frac{c_{3} \sqrt{n}}{\sqrt{\pi v}} K_{a, c_{4}}\left(\frac{v}{2}\right)+\left(\frac{\widetilde{C} \sqrt{2}}{v \sqrt{\pi}}+\frac{1}{v}\right) F(\bar{x})\right\}\left|x-x^{\prime}\right| .
$$

Therefore, for all $0 \leq t \leq n$ and $x, x^{\prime} \in[-n, n], I\left(t, x ; t, x^{\prime}\right) \leq \widetilde{C}_{n, 3}^{*}\left|x-x^{\prime}\right|$ with

$$
\begin{aligned}
\widetilde{C}_{n, 3}^{*}= & c^{2} K_{a, 1}(2 v n)\left\{\frac{c_{3} \sqrt{n}}{\sqrt{\pi v}} K_{a, c_{4}}\left(\frac{v}{2}\right)\right. \\
& \left.+\left(\frac{\widetilde{C} \sqrt{2}}{v \sqrt{\pi}}+\frac{1}{v}\right) \sup _{(s, y) \in[0, n] \times[-n, n]}\left(g * G_{\nu / 2}(s, \cdot)\right)(y)\right\},
\end{aligned}
$$

and $\widetilde{C}_{n, 3}^{*}<+\infty$ by definition of $g$. Finally, the contribution of the constant $\bar{\zeta}$ in (4.4) is given in Proposition 5.2. Therefore, one can choose

$$
C_{n, 3}^{*}=\frac{\bar{\varsigma}^{2}}{v}+2 \widetilde{C}_{n, 3}^{*} .
$$

Property (4.5) As for (4.5), notice that $J_{0}^{*}(t, x) \leq c\left(e^{|\cdot|^{a}} * G_{\nu}(t, \cdot)\right)(x)$. By checking the proof of part (1) (see (4.23)), one can choose,

$$
C_{n, 5}^{*}=\frac{\bar{\varsigma}^{2}}{\sqrt{\pi v}}+2 c^{2} \sqrt{\pi / v} \sup _{(s, y) \in[0, n] \times[-n, n]}\left(e^{|\cdot|^{a}} * G_{v}(2 s, \cdot)\right)^{2}(y) .
$$

This completes the proof of part (2) of Proposition 4.4.

Proof of Proposition 4.5 (2) If $\mu \in \mathcal{M}_{H}^{*}(\mathbb{R})$, then by Proposition 4.4 (2), the 1.h.s. of (4.7) is bounded by

$$
C_{n, 1}^{*} \sqrt{t^{\prime}-t}\left(1 \star G_{v}^{2}\right)(t, x)=C_{n, 1}^{*} \frac{\sqrt{t}}{\sqrt{\pi v}} \sqrt{t^{\prime}-t} \leq C_{n, 1}^{*} \frac{\sqrt{n}}{\sqrt{\pi v}} \sqrt{t^{\prime}-t}
$$

Hence, $C_{n, 2}^{*}=\frac{\sqrt{n}}{\sqrt{\pi \nu}} C_{n, 1}^{*}$. The same arguments apply to the other two constants $C_{n, 4}^{*}$ and $C_{n, 6}^{*}$, i.e., (4.8) and (4.9). Note that it was not possible to use the above argument in the proof of part (1) of Proposition 4.4. This completes the proof of Proposition 4.5 (2).

### 4.5 Checking the initial condition

Proof of Proposition 3.4 Because $u(t, x)=J_{0}(t, x)+I(t, x)$, and because it is standard that (see [14, Chapter 7, Sect. 6] and also [4, Lemma 2.6.14, p.89]),

$$
\lim _{t \rightarrow 0_{+}} \int_{\mathbb{R}} \mathrm{d} x J_{0}(t, x) \phi(x)=\int_{\mathbb{R}} \mu(\mathrm{d} x) \phi(x),
$$

we only need to prove that

$$
\lim _{t \rightarrow 0_{+}} \int_{\mathbb{R}} \mathrm{d} x I(t, x) \phi(x)=0 \text { in } L^{2}(\Omega) .
$$

Recall that the Lipschitz continuity of $\rho$ implies the linear growth condition (2.1). Fix $\phi \in C_{c}^{\infty}(\mathbb{R})$. Denote $L(t):=\int_{\mathbb{R}} I(t, x) \phi(x) \mathrm{d} x$. By the stochastic Fubini theorem (see [28, Theorem 2.6, p. 296]), whose assumptions are easily checked,

$$
L(t)=\int_{0}^{t} \int_{\mathbb{R}}\left(\int_{\mathbb{R}} \mathrm{d} x G_{\nu}(t-s, x-y) \phi(x)\right) \rho(u(s, y)) W(\mathrm{~d} s, \mathrm{~d} y) .
$$

Hence, by (2.1),

$$
\mathbb{E}\left[L(t)^{2}\right] \leq \mathrm{L}_{\rho}^{2} \int_{0}^{t} \mathrm{~d} s \int_{\mathbb{R}} \mathrm{d} y\left(\int_{\mathbb{R}} \mathrm{d} x G_{\nu}(t-s, x-y) \phi(x)\right)^{2}\left(\bar{\zeta}^{2}+\|u(s, y)\|_{2}^{2}\right)
$$

By the moment formula (2.5), we can write the above upper bound as

$$
\mathbb{E}\left[L(t)^{2}\right] \leq \mathrm{L}_{\rho}^{2}\left[L_{1}(t)+L_{2}(t)+L_{3}(t)+L_{4}(t)\right],
$$

where

$$
\begin{aligned}
& L_{1}(t)=\int_{0}^{t} \mathrm{~d} s \int_{\mathbb{R}} \mathrm{d} y\left(\int_{\mathbb{R}} \mathrm{d} x G_{\nu}(t-s, x-y) \phi(x)\right)^{2} J_{0}^{2}(s, y) \\
& L_{2}(t)=\int_{0}^{t} \mathrm{~d} s \int_{\mathbb{R}} \mathrm{d} y\left(\int_{\mathbb{R}} \mathrm{d} x G_{\nu}(t-s, x-y) \phi(x)\right)^{2}\left(J_{0}^{2} \star \overline{\mathcal{K}}\right)(s, y) \\
& L_{3}(t)=\bar{\zeta}^{2} \int_{0}^{t} \mathrm{~d} s \overline{\mathcal{H}}(s) \int_{\mathbb{R}} \mathrm{d} y\left(\int_{\mathbb{R}} \mathrm{d} x G_{\nu}(t-s, x-y) \phi(x)\right)^{2} \\
& L_{4}(t)=\bar{\zeta}^{2} \int_{0}^{t} \mathrm{~d} s \int_{\mathbb{R}} \mathrm{d} y\left(\int_{\mathbb{R}} \mathrm{d} x G_{\nu}(t-s, x-y) \phi(x)\right)^{2}
\end{aligned}
$$

From now on, we may assume that $\mu \in \mathcal{M}_{H,+}(\mathbb{R})$, because otherwise, one can simply replace the above $J_{0}(s, y)$ by $J_{0}^{*}(s, y)=\left(|\mu| * G_{\nu}(s, \circ)\right)(y)$.
(1) Consider $L_{1}(t)$ first. Write out both $J_{0}^{2}(s, y)$ and $\left(\int_{\mathbb{R}} \mathrm{d} x G_{\nu}(t-s, x-y) \phi(x)\right)^{2}$ in the forms of double integrals, and apply Lemma 5.3, to see that

$$
\begin{align*}
L_{1}(t)= & \int_{0}^{t} \mathrm{~d} s \int_{\mathbb{R}} \mathrm{d} y\left(\iint_{\mathbb{R}^{2}} \mathrm{~d} x_{1} \mathrm{~d} x_{2} G_{\nu / 2}(t-s, \bar{x}-y) G_{2 v}(t-s, \Delta x) \phi\left(x_{1}\right) \phi\left(x_{2}\right)\right) \\
& \times \iint_{\mathbb{R}^{2}} \mu\left(\mathrm{~d} z_{1}\right) \mu\left(\mathrm{d} z_{2}\right) G_{\nu / 2}(s, \bar{z}-y) G_{2 v}(s, \Delta z), \tag{4.29}
\end{align*}
$$

where $\bar{x}=\frac{x_{1}+x_{2}}{2}, \Delta x=x_{1}-x_{2}$ and similarly for $\bar{z}$ and $\Delta z$. Integrate over $\mathrm{d} y$ first using the semigroup property of the heat kernel and then integrate over $\mathrm{d} s$ by using Lemma 5.5, we see that

$$
\begin{aligned}
L_{1}(t)= & \iint_{\mathbb{R}^{2}} \mathrm{~d} x_{1} \mathrm{~d} x_{2} \phi\left(x_{1}\right) \phi\left(x_{2}\right) \iint_{\mathbb{R}^{2}} \mu\left(\mathrm{~d} z_{1}\right) \mu\left(\mathrm{d} z_{2}\right) \\
& \times G_{\nu / 2}(t, \bar{x}-\bar{z}) \frac{1}{4 v} \operatorname{erfc}\left(\frac{1}{\sqrt{4 v t}}[|\Delta x|+|\Delta z|]\right) .
\end{aligned}
$$

By (5.2),

$$
\begin{aligned}
\operatorname{erfc}\left(\frac{1}{\sqrt{4 v t}}[|\Delta x|+|\Delta z|]\right) & \leq e^{-\frac{(|\Delta x|+|\Delta z|)^{2}}{4 v t}} \leq e^{-\frac{|\Delta x|^{2}}{4 v t}} e^{-\frac{|\Delta z|^{2}}{4 v t}} \\
& =4 \pi v \sqrt{t} G_{2 v}\left(1, \frac{\Delta x}{\sqrt{t}}\right) G_{2 v}(t, \Delta z)
\end{aligned}
$$

By the change of variables $y=\left(x_{1}+x_{2}\right) / 2$ and $w=\left(x_{1}-x_{2}\right) / \sqrt{t}$,

$$
\begin{array}{rl}
L_{1}(t) \leq \pi t \iint_{\mathbb{R}^{2}} & \mathrm{~d} y \mathrm{~d} w G_{2 v}(1, w) \phi\left(y+\frac{\sqrt{t}}{2} w\right) \phi\left(y-\frac{\sqrt{t}}{2} w\right) \\
& \times \iint_{\mathbb{R}^{2}} \mu\left(\mathrm{~d} z_{1}\right) \mu\left(\mathrm{d} z_{2}\right) G_{\nu / 2}(t, y-\bar{z}) G_{2 v}(t, \Delta z)
\end{array}
$$

By Lemma 5.4,

$$
\iint_{\mathbb{R}^{2}} \mu\left(\mathrm{~d} z_{1}\right) \mu\left(\mathrm{d} z_{2}\right) G_{v / 2}(t, y-\bar{z}) G_{2 v}(t, \Delta z) \leq 2\left(\mu * G_{2 v}(t, \cdot)\right)^{2}(y)=2 J_{0}^{2}(2 t, y)
$$

For some constants $a$ and $c \geq 0,|\phi(x)| \leq c 1_{[-a, a]}(x)$. If $|y|>a$, then the two sets $\left\{w \in \mathbb{R}:\left|\frac{\sqrt{t}}{2} w \pm y\right| \leq a\right\}$ have empty intersection. Hence,

$$
L_{1}(t) \leq 2 c^{2} \pi \int_{|y| \leq a} \mathrm{~d} y t J_{0}^{2}(2 t, y) \int_{\mathbb{R}} \mathrm{d} w G_{2 v}(1, w)=2 c^{2} \pi \int_{|y| \leq a} \mathrm{~d} y t J_{0}^{2}(2 t, y) .
$$

Clearly, by assuming that $t \leq 1$,

$$
\sqrt{t} J_{0}(2 t, y)=\int_{\mathbb{R}} \mu(\mathrm{d} x) \frac{1}{\sqrt{4 \pi v}} e^{-\frac{(y-x)^{2}}{4 v t}} \leq \int_{\mathbb{R}} \mu(\mathrm{d} x) \frac{1}{\sqrt{4 \pi v}} e^{-\frac{(y-x)^{2}}{4 \nu}}=J_{0}(2, y) .
$$

Hence, Lebesgue's dominated convergence theorem implies that

$$
\lim _{t \rightarrow 0} \sqrt{t} J_{0}(2 t, y)=0
$$

Because $\int_{|y| \leq a} \mathrm{~d} y J_{0}^{2}(2, y)<+\infty$, by another application of Lebesgue's dominated convergence theorem, we see that $\lim _{t \rightarrow 0} L_{1}(t)=0$.
(2) As for $L_{2}(t)$, because $\overline{\mathcal{K}}(t, x) \leq G_{\nu / 2}(t, x) \frac{1}{\sqrt{t}} h(t)$, where $h(t):=\mathrm{L}_{\rho}^{2}\left(\frac{1}{\sqrt{4 \pi v}}+\right.$ $\left.\frac{\mathrm{L}_{\rho}^{2} \sqrt{t}}{2 v} e^{\frac{\mathrm{L}_{\rho}^{4} t}{4 v}}\right)$ is a nondecreasing function in $t$, we see that as in (4.29),

$$
\begin{aligned}
L_{2}(t) \leq \int_{0}^{t} \mathrm{~d} s & \int_{\mathbb{R}} \mathrm{d} y \iint_{\mathbb{R}} \mathrm{d} x_{1} \mathrm{~d} x_{2} G_{\nu / 2}(t-s, \bar{x}-y) G_{2 v}(t-s, \Delta x) \phi\left(x_{1}\right) \phi\left(x_{2}\right) \\
& \times \int_{0}^{s} \mathrm{~d} r \int_{\mathbb{R}} \mathrm{d} w G_{\nu / 2}(s-r, y-w) \frac{1}{\sqrt{s-r}} h(t) \\
& \times \int_{\mathbb{R}^{2}} \mu\left(\mathrm{~d} z_{1}\right) \mu\left(\mathrm{d} z_{2}\right) G_{\nu / 2}(r, \bar{z}-w) G_{2 v}(r, \Delta z)
\end{aligned}
$$

Integrate first over $\mathrm{d} w$ using the semigroup property of the heat kernel, and then integrate over $\mathrm{d} r$ using (5.1), to find that

$$
\begin{aligned}
L_{2}(t) \leq & \pi h(t) \sqrt{t} \int_{0}^{t} \mathrm{~d} s \int_{\mathbb{R}} \mathrm{d} y \iint_{\mathbb{R}} \mathrm{d} x_{1} \mathrm{~d} x_{2} G_{\nu / 2}(t-s, \bar{x}-y) \\
& \times G_{2 v}(t-s, \Delta x) \phi\left(x_{1}\right) \phi\left(x_{2}\right) \iint_{\mathbb{R}^{2}} \mu\left(\mathrm{~d} z_{1}\right) \mu\left(\mathrm{d} z_{2}\right) G_{\nu / 2}(s, \bar{z}-y) G_{2 v}(s, \Delta z)
\end{aligned}
$$

Comparing the above bound with (4.29), we see that

$$
L_{2}(t) \leq \pi \sqrt{t} h(t) L_{1}(t) \rightarrow 0, \quad \text { as } t \rightarrow 0 .
$$

(3) Notice that $L_{3}(t) \leq \overline{\mathcal{H}}(t) L_{4}(t)$, so we only need to consider $L_{4}(t)$, which is a special case of $L_{1}(t)$ with $\mu(\mathrm{d} x)=\bar{\varsigma} \mathrm{d} x$. Since this $\mu$ belongs to $\mathcal{M}_{H}(\mathbb{R})$, $\lim _{t \rightarrow 0_{+}} L_{4}(t)=0$ by part (1). This completes the proof of Proposition 3.4.

## Appendix

Lemma 5.1 If $|f(x)| \leq c_{1} e^{c_{2}|x|^{a}}$ for all $x \in \mathbb{R}$ with $c_{1}, c_{2}>0$ and $\left.a \in\right] 1,2[$, then there is $c_{3}<+\infty$ such that for all $\left.b \in\right] a, 2\left[,|f(x)| \leq c_{3} e^{|x|}{ }^{b}\right.$ for all $x \in \mathbb{R}$.

Proof Notice that $c_{2}|x|^{a} \geq|x|^{b}$ if and only if $|x| \leq c_{2}^{\frac{1}{b-a}}$. Hence, $c_{2}|x|^{a}-|x|^{b} \leq$ $c_{2} c_{2}^{\frac{a}{b-a}}-0=c_{2}^{\frac{b}{b-a}}$. Therefore, $c_{1} \exp \left(c_{2}|x|^{a}-|x|^{b}\right) \leq c_{1} \exp \left(c_{2}^{\frac{b}{b-a}}\right)=: c_{3}$.

Proposition 5.2 (Proposition 3.5 of [5]) There are three universal and optimal constants $C_{1}=1, C_{2}=\frac{\sqrt{2}-1}{\sqrt{\pi}}$, and $C_{3}=\frac{1}{\sqrt{\pi}}$, such that for all $s, t$ with $0 \leq s \leq t$ and $x \in \mathbb{R}$,

$$
\begin{aligned}
& \int_{0}^{t} \mathrm{~d} r \int_{\mathbb{R}} \mathrm{d} z\left[G_{v}(t-r, x-z)-G_{v}(t-r, y-z)\right]^{2} \leq \frac{C_{1}}{v}|x-y|, \\
& \int_{0}^{s} \mathrm{~d} r \int_{\mathbb{R}} \mathrm{d} z\left[G_{v}(t-r, x-z)-G_{v}(s-r, x-z)\right]^{2} \leq \frac{C_{2}}{\sqrt{v}} \sqrt{t-s}, \\
& \int_{s}^{t} \mathrm{~d} r \int_{\mathbb{R}} \mathrm{d} z\left[G_{v}(t-r, x-z)\right]^{2} \leq \frac{C_{3}}{\sqrt{v}} \sqrt{t-s},
\end{aligned}
$$

$$
\iint_{\mathbb{R}_{+} \times \mathbb{R}}\left(G_{\nu}(t-r, x-z)-G_{\nu}(s-r, y-z)\right)^{2} \mathrm{~d} r \mathrm{~d} z \leq 2 C_{1}\left(\frac{|x-y|}{\nu}+\frac{\sqrt{|t-s|}}{\sqrt{v}}\right),
$$

where we use the convention that $G_{v}(t, \cdot) \equiv 0$ if $t \leq 0$.
Lemma 5.3 (Lemma 5.4 of [5]) For all t, $s>0$ and $x, y \in \mathbb{R}$, we have that $G_{v}^{2}(t, x)=$ $\frac{1}{\sqrt{4 \pi \nu t}} G_{\nu / 2}(t, x)$ and $G_{v}(t, x) G_{v}(s, y)=G_{v}\left(\frac{t s}{t+s}, \frac{s x+t y}{t+s}\right) G_{v}(t+s, x-y)$.
Lemma 5.4 (Lemma 5.5 of [5]) For all $x, z_{1}, z_{2} \in \mathbb{R}$ and $t, s>0$, denote $\bar{z}=\frac{z_{1}+z_{2}}{2}$, $\Delta z=z_{1}-z_{2}$. Then $G_{1}(t, x-\bar{z}) G_{1}(s, \Delta z) \leq \frac{(4 t) \vee s}{\sqrt{t s}} G_{1}\left((4 t) \vee s, x-z_{1}\right) G_{1}((4 t)$ $\left.\vee s, x-z_{2}\right)$, where $a \vee b:=\max (a, b)$.

Lemma 5.5 (Lemma 5.10 of [5]) For $0 \leq s \leq t$ and $x, y \in \mathbb{R}$, we have that

$$
\int_{0}^{t} \mathrm{~d} s G_{\nu}(s, x) G_{\sigma}(t-s, y)=\frac{1}{2 \sqrt{\nu \sigma}} \operatorname{erfc}\left(\frac{1}{\sqrt{2 t}}\left(\frac{|x|}{\sqrt{v}}+\frac{|y|}{\sqrt{\sigma}}\right)\right)
$$

where $v$ and $\sigma$ are strictly positive. In particular, by letting $x=0$, we have that

$$
\begin{equation*}
\int_{0}^{t} \mathrm{~d} s \frac{G_{\sigma}(t-s, y)}{\sqrt{2 \pi v s}}=\frac{1}{2 \sqrt{v \sigma}} \operatorname{erfc}\left(\frac{|y|}{\sqrt{2 \sigma t}}\right) \leq \frac{\sqrt{\pi t}}{\sqrt{2 v}} G_{\sigma}(t, y) . \tag{5.1}
\end{equation*}
$$

Note that the inequality in (5.1) is because by [19, (7.7.1), p.162],

$$
\begin{equation*}
\operatorname{erfc}(x)=\frac{2}{\pi} e^{-x^{2}} \int_{0}^{\infty} \mathrm{d} t \frac{e^{-x^{2} t^{2}}}{1+t^{2}} \leq \frac{2}{\pi} e^{-x^{2}} \int_{0}^{\infty} \mathrm{d} t \frac{1}{1+t^{2}}=e^{-x^{2}} \tag{5.2}
\end{equation*}
$$

Lemma 5.6 For $t>0, v>0$ and $x \in \mathbb{R}$, we have that

$$
\int_{0}^{t} \mathrm{~d} s G_{\nu}(s, x)=2 t G_{v}(t, x)-\frac{|x|}{v} \operatorname{erfc}\left(\frac{|x|}{\sqrt{2 v t}}\right) .
$$

Proof The case where $x=0$ can be easily verified. Assume that $x \neq 0$. By change of variables $y=|x| / \sqrt{2 \nu s}$ and integration by parts, we have that

$$
\int_{0}^{t} \mathrm{~d} s G_{v}(s, x)=\int_{\frac{|x|}{\sqrt{2 v t}}}^{+\infty} \mathrm{d} y \frac{|x|}{\sqrt{\pi} v y^{2}} e^{-y^{2}}=\left.\frac{|x|}{\sqrt{\pi} v y} e^{-y^{2}}\right|_{+\infty} ^{\left\lvert\, \frac{|x|}{\sqrt{2 v t}}\right.}-\frac{|x|}{v} \int_{\frac{|x|}{\sqrt{2 v t}}}^{+\infty} \mathrm{d} y \frac{2}{\sqrt{\pi}} e^{-y^{2}}
$$

Therefore, the conclusion follows from the definition of the function $\operatorname{erfc}(\cdot)$.

Lemma 5.7 If $v>0, t>0, n>1$ and $x \in \mathbb{R}$, then for $r \in\left[0, n^{2} t\right]$,

$$
\begin{aligned}
\left|\frac{G_{\nu / 2}(t+r, x)}{G_{v / 2}(t, x)}-1\right| & \leq \frac{3 r}{t+r} \exp \left(\frac{n^{2} x^{2}}{v t\left(1+n^{2}\right)}\right) \\
& \leq \frac{3}{2} \frac{\sqrt{r\left(1+n^{2}\right)}}{\sqrt{t}} G_{\frac{v}{2}}^{-1}(t, x) G_{\frac{v\left(1+n^{2}\right)}{2}}(t, x) .
\end{aligned}
$$

Proof Fix $v>0, t>0, n>1$, and $x \in \mathbb{R}$. For $r \in\left[0, n^{2} t\right]$, define

$$
g_{t, x}(r)=\frac{G_{\nu / 2}(t+r, x)}{G_{\nu / 2}(t, x)}-1=\frac{\sqrt{t}}{\sqrt{t+r}} \exp \left(\frac{x^{2}}{\nu t} \frac{r}{t+r}\right)-1
$$

Clearly $g_{t, x}(0)=0$. Notice that

$$
\left|g_{t, x}(r)\right| \leq\left|\exp \left(\frac{x^{2}}{v t} \frac{r}{t+r}\right)-1\right|+\exp \left(\frac{x^{2}}{v t} \frac{r}{t+r}\right)\left|\frac{\sqrt{t}}{\sqrt{t+r}}-1\right|
$$

The second term on the right-hand side is bounded by $\exp \left(\frac{n^{2} x^{2}}{v\left(1+n^{2}\right) t}\right) \frac{r}{t+r}$ for all $r \in\left[0, n^{2} t\right]$, because $\frac{r}{r+t} \in\left[0, \frac{n^{2}}{1+n^{2}}\right]$ for $r \in\left[0, n^{2} t\right]$. To bound the first term, we use the fact that for fixed $a>0$ and $b>0,0 \leq e^{a h}-1 \leq e^{a b} \frac{h}{b}$ for all $h \in[0, b]$. Apply this fact to $\exp \left(\frac{x^{2}}{v t} \frac{r}{t+r}\right)-1$ with $a=\frac{x^{2}}{v t}, h=\frac{r}{r+t}$ and $b=\frac{n^{2}}{1+n^{2}}$ : the first term is bounded by $2 \exp \left(\frac{n^{2} x^{2}}{v t\left(1+n^{2}\right)}\right) \frac{r}{r+t}$ for all $r \in\left[0, n^{2} t\right]$. Adding these two bounds proves the first inequality. The second one follows from the inequality $t+r \geq 2 \sqrt{t r}$.

Lemma $5.8 \int_{t}^{t^{\prime}} \frac{1}{\sqrt{s\left(t^{\prime}-s\right)}} \mathrm{d} s=2 \arcsin \left(\sqrt{\frac{t^{\prime}-t}{t^{\prime}}}\right)$ for all $t^{\prime}>0$ with $t^{\prime} \geq t \geq 0$.
Proof For $t=0$, the 1.h.s. reduces to the Beta integral (see, e.g., (3.3). If $\left.t \in] 0, t^{\prime}\right]$, differentiate with respect to $t$ on both sides.
