Chapter 13. Market-Making and Delta-Hedging

Chapter 13. Market-Making and Delta-Hedging

§ 13.1 What do market-makers do?

§ 13.2 Market-maker risk

§ 13.3 Delta-Hedging

§ 13.4 The mathematics of Delta-hedging

§ 13.5 The Black-Scholes analysis

§ 13.6 Market-Making as insurance

§ 13.7 Problems

Chapter 13. Market-Making and Delta-Hedging

§ 13.1 What do market-makers do?

§ 13.2 Market-maker risk

§ 13.3 Delta-Hedging

§ 13.4 The mathematics of Delta-hedging

§ 13.5 The Black-Scholes analysis

§ 13.6 Market-Making as insurance

§ 13.7 Problems

From the previous section we see that

$$\text{Market-maker's profit} = - \left(\frac{1}{2} \sigma^2 S_t^2 \Gamma_t + \theta_t + r [\Delta_t S_t - C(S_t)] \right) h$$

If one believes that via one-standard deviation move, the market-maker's profit is approximately zero, we arrive at the **Black-Scholes equation**:

$$\frac{1}{2} \sigma^2 S_t^2 \Gamma_t + \theta_t + r \Delta_t S_t = r C(S_t)$$

Equivalently, this can be written as a standard PDE:

$$\mathcal{L}_{\text{BS}} V(t, \mathcal{S}) = 0$$

where $V(t, \mathcal{S})$ refers to option (call or put) price and

$$\mathcal{L}_{\text{BS}} = \frac{\partial}{\partial t} + \frac{1}{2} \sigma^2 \mathcal{S}^2 \frac{\partial^2}{\partial \mathcal{S}^2} + r \mathcal{S} \frac{\partial}{\partial \mathcal{S}} V(t, \mathcal{S}) - r.$$

One still needs to put the correct boundary conditions.

- ▶ Under the following assumptions:
 - Underlying asset and the option do not pay dividends
 - Interest rate and volatility are constant
 - The stock does not make large discrete moves

- ▶ The equation is valid only when early exercise is not optimal
